parts.  That Flash one sounds right.  I can't remember who it was who used
there drive for digital camera (wasn't lp).  If you use normal drive for
main system, then just use your flash drive for saving work to and spin
down the noisy HD.  I'm sure you could get cheaper ones at 32MB only.
Enough for midi tracks right?

Hi Hallvard,

>Are there any similar DIY memory projects around?
>I don't really want to spend more on a memory upgrade than the total
>cost of the computer.

They were about �100, populated with maximum memory. That sounds good to
me considering the small batch.

Hi,

I want to upgrade my SF354 single desity drive to double density. I
got a common PC 1.44 HDD drive. Anyone knows where can I find some
info on that?
Thanks for all!

Facundo

Hi Hallvard!

Chips&Chips give it as a PC900.

Regards, /Peter/

Note that such a drive will hardly be faster when connected to an Atari than a "real" hard disk drive. The data transfer rate is limited by the Atari's DMA hardware.

If these drives are compatible to the SCSI standard and implement the
SCSI commands that are implemented by "real" hard disk drives they will
work with the Atari like any other drive.

I've had this problem with Link 97 and a Zip drive and a SCSI Quantum HD.
It has always been a bad contact on one of the many pins - the whole set-up
is very sensitive to cables being twisted or moved. Take them all out and
wiggle them back in again, then try. It will come right.

I want to stick a colour printer on the serial port (there is already a laser on the parallel) and have an old Epson 500 which will do the job.

But, the serial port is a mini 8-pin DIN meant for a Mac connection. I can obviously lash up a connector but I cannot find the pin-out for the Epson serial anywhere. Anyone got any specs?

Major update, I found that the PSU was at fault%^��$�^$�"!! Anyway I
repaired that and ran it for 3 days, bought it home from work and fired it
up, to which nothing happened. I think the CPU has gone phut. I cheched the
GSTShifter and everything but noticed that the CPU wasn't getting very warm.
So maybee it is just not ment to be. I will probably try again in around a
couple of months. On a nicer note I fixxed 2 STFM's this week ;-). As pre
the sockets etc I have 5 FM's and they are ALL different. I too have some
socketed chips with white dots from dead boards I used as parts. I think
Atari just got bored and said this will stuff them..

Mark

I care, too. However, the reviewers are probably using modern PCs, which
have one fan on the CPU, two on the graphics card and one in the PSU. All
that noise could drown out any HD noise.
It's different if you're using an Atari STe.

Hello - new here so please don't bite.

I have recently aquired a Mega ST 2 a Mega ST 4 and a 520STFM.

The two Mega ST's need a monitor, so have been unable to test yet.

The 520STFM look like it has a newer TOS version than it should have (its copyright 1989, and the Atari logo scrolls lots of colours).

Questions:

Can i use a ST monitor connector to SCART connector for the Mega ST's so I can view them on my TV rather than source a hard-to-find monitor?

Failing that, can I use a monitor like the commodore 1084s or phillips ? Would it come with the right connector or is the ST one proprietry?

Can I still get the Atari 520STFM upgraded to 1 meg as it is only 512k and some games won't play?

What are the Mega ST's worth nowadays?

Cheers
Switch

No special drivers needed. At least the ones I bought 'Microtech' work like zip drives for the most part. Sometimes I have to force a media change, but only when swapping smartmedia cards. If you leave them in at bootup and don't change them it works like a solid state HD.
That is when they are formatted on the Atari, the DOS formatted cards from the camera seem to require a forced media change. Needless to say I get the images off the camera way faster than PhotoTip can with an rs232 cable.

> Would a solid-state harddisk drive work in much the same way?

They do make solid state EIDE hard drives that mimic the full standard and mount the same way. They are not cheap however, and are aimed at servers. If you go to the sansdisk site I think you will find them there.

The smartmedia is slower than a real HD, but it's weird not hearing any noise, and no moving parts to go bad. I've read compactflash is faster and those go up to 512mb or more. I can get an adapter for these too, but so far I've been happy with the smartmedia since the camera already uses it.

That's if the drive is attached to an IDE interface. Even TOS 1.00 would
boot from a hard drive on the DMA port.

Hi all !

I very happy to say, that i finished a full public realease of a small interface PS/2, which allows to connect a PS/2 Keyboard and a standard PS/2 mouse (With 2/3 buttons) or enhanced PS/2 wheel mouse. (News keys are usable, as Win left...)

The board is very small, only 35mmX48mm, and can be embedded directly into a Atari machine or as external adapater inside a small box.

This one only need a driver for remapped "special" keyboard keys, as with the Adaptakey from Oxo compagny (for example, the key +=); mouse don't need any driver to work immediatly as with a standard atari mouse.

But, a new driver is currently worked, will allow to get the same behaviour that the from Oxo, to remapped the keys, and get the mouse's wheel running.

Because i have now a full interface running and already connected to my Falcon, i can let you the somes prices:

Internal release (for mother board keyboard connector): 250 Frs-38 Euros
External release (with RJ-12 connector, for Mega ST/STE/TT): 290 Frs-44 Euros

I expected to get more informations as soon as possible, about the driver...

Laurent

Yes, provided that the TV SCART input has Red-Green-Blue connected, not
only composite video (there is some cheating on SCARTs in some TVs).
But this would only be usable for ST-low and ST-medium resolutions.

>Failing that, can I use a monitor like the commodore 1084s or phillips ?

You can connect most SVGA monitors to obtain a monochrome pictyure
in ST-high resolution; the monitor should be able to handle 35.7kHz
horizontal sync and 71Hz vertical sync rate. Preferably, the monitor should
be monochrome. A multisync monitor might be able to handle all three
ST resolutions. Note: using a SVGA monitor involves some fiddling with
connectors and cable.

>Would it come with the right connector or is the ST one proprietry?

ST has a rarely found DIN-13 monitor connector which is unlikely to be
found on any other monitor. When all else failed, I know that some people
have actually -made- the connector: fortunately pins are arranged in three
rows with 0.1 inch raster.

I'll take a peek in my STE next time the side is off it.  Shouldn't be
more than a day or two as I'm busy with it.  These opto-isolators are all
pretty similar.  LED and a sensor, that's about it.

I would try making a mac to serial port adaptor.  This is RS232 to RS4xx
(sorry not sure about numbers).  I think it is harder to go that way than
the other way, although it may work.  Anyone else?

Not sure, I think they have stopped selling them. Try second hand but the
chances of finding one are unlikly.

Hello,

While I waited for information from the newsgroup about VME RAM cards
avaliable in the market (it seems that no one knows about them), I did some
research along the net. EKF (Germany) makes one that is likely to work ,

but the minimum order quantity is 50 units :(.
When I was about to give up, I found that some American dealers sell VME
3U RAM cards for old SUN workstations. More explicity, they have in stock
the model 501-1317, a 16 x 1MB 30 pin SIMM (4 banks) board that only admits
8 or 16 MB configuration (It is documented in SUN info base). It is designed
for 4/330 workstation. There is no way to set up the starting address of the
memory. If I fully populate it, I supose that the Mega could access the
sharing 4MB of address space. But I'm not sure if it would access the first or
third bank.
Would it work?.
Thanks, Michael, for the tips about the driver.

Regards.

About I year ago, I tried to order one for my Mega STE from Aixit homepage. They replied that they hadn't them in stock, and even worse, they were not going to be prouced any more.

Anyway perhaps they have still stock of the plain ST or STE models.

Regards.

news:3c0021e653a5e2@madasafish.com...

Thanks Lyndon,

> I would try making a mac to serial port adaptor. This is RS232 to RS4xx
> (sorry not sure about numbers). I think it is harder to go that way than
> the other way, although it may work. Anyone else?

I did a long Googling session yesterday and discovered that the Epson
printer "Mac" port is RS422 working up to 230Kbps.

A bit more poking around threw up
www.cc.ic.ac.uk/helpdesk/apriori/15.1310.html which was very useful.

Apparently RS422 has symmetric (+ and -) 5v signals for Rx, Tx and a rather simple handshaking arrangement which can be wired to look like RS232. The author gives a useful example:

Mac MCC-8 RS422	PC DB-9 RS232
1 (HSKo)	6 (DSR)
2 (HSKi)	4 (DTR)
3 (TXD-)	2 (RXD)
4 (GND) + 8 (RXD+)	5 (GND)
5 (RXD-)	3 (TXD)

So, I shall get the bits and try a bit of knitting! The big bother seems to be soldering the mini 8 DIN which is said to be a bit of a bugger.

Roger

I have reports that it may have a problem with Blitters. You can try
as it doesn't take too much time. I Would be interestted if you
could. Check out my website for the hack, I have no written docs and
schematics for it.

There should be enough left, although not at Aixit - Aixit did not produce
the cards, they only sold them, and not exclusively.

At least Axel Gehringer and Woller should know who to contact to get some.

As I took part in the design of that hack and also tested it a little in a machine containing the blitter chip, I can comment on that item:

It seems that if a machine does -not- have a blitter active, then it is sufficient to recognize bus access by address strobe signals (-AS or -UDS,-LDS) and switch from 16MHz to 8MHz while those signals are active. But if a blitter is active, the machine should also switch to 8MHz while the bus the mastered by the blitter (or the negotiation to do so is in progress), and bus request, bus grant, and possibly even bus grant acknowledge (-BR, -BG, -BGACK) signals are active.

The issue is complicated (at least in a MegaST) by the fact that there is a hardware patch (the "piggyback board") which fixes the behaviour of some faulty blitters and prolongs the duration of -BGACK active untill the next CPU clock rising edge.

These results are not conclusive, because it appears that, in order to make the accelerator run reliably on my machine, I would have to replace a couple of critical 74LS244 and '373 chips on the motherboard with faster 74F***, and also my 200ns ROMs with 120ns ones; all that has been suggested in several places as a prerequisite for running -any- kind of accelerator.

to comp.sys.atari.tech and comp.sys.atari.tech

I just bought from someone online a Mega ST4 and an Atari hard drive, SH205. I'm having trouble with getting the hard drive running.

First of all, I used several Atari computers from when they first came out until when I bought my first IBM compatible PC in 94. Since then I've only used my old Atari to run certain programs I created for my work and haven't yet ported to the PC. My Atari's floppy stopped working which is why I bought a system online. For my old Atari I had a hard drive custom built before the Atari hard drives came out.

Anyways, the fellow who sold me the Atari said that he wiped the hard drive clean but reinstalled the Atari hard drive software so it should boot up, but it doesn't.

I'm not even sure I have the hard drive plugged in properly. It has 2 ports on the back, one is "out" and one is "in". I presume the "out" is the one to use. I vaguely remember that it is necessary to first turn on the hard drive, let it come up, then turn on the computer. What happens is that the computer's drive "A" light stays on and the hard drive doesn't come up. If I put a floppy in the drive, the light will go off but the computer can't see the floppy complaining that the disc or floppy drive is no good and I do not see an icon for the hard drive. If I turn the computer on without the hard drive turned on, then the computer successfully sees drive A.

The fellow who sold me the computer then emailed me what he says is the Atari hard drive software. It consists of 2 folders. The first is called Ahdi and in it are 2 files, Ahdi.prg and Shdriv.sys. The other folder is Hdx and in it are Hdx.prg and Hdx.rsc.

So, how do I install this hard drive software? What steps are necessary as far as turning on the computer and hard drive and what should be in the floppy? Do I need to remove those files from the folders?

I used to be really good at Atari tech stuff and did a lot of programming with Laser C. But, it's been almost 10 years since I did any such tech stuff- and I don't have the hard drive installation instructions.

I wouldn't be surprised the hard drive has the software already installed but I must be doing something wrong.

Help will be greatly appreciated.

Isn't it the other way round? IN to receive data from the computer and OUT to daisy-chain another drive?

Go ahead! They aren't that bad, I just worked my way out, starting on the
middle pins first. Not as bad as the 13pin or 14pin Atari connectors!!

I've got a serious problem with my harddrive.
By mistake I put a file in my c:\auto folder that makes my MEGA ST2
hang..
When I boot it only shows 4 bombs...
Is there any way I can get to my HD after I booted without having it on?

(I know the name of the file that causes the problem.)

TIA

I don't know. Should I plug into the "IN" socket?

But, what about the software? I have these 4 files files, Ahdi.prg,
Shdriv.sys, Hdx.prg, Hdx.rsc. What do I do with them? I have no
instructions. Do they go into the Auto folder? Do I run them?

I acquired a ST happy discovery cartridge about 4-6 years ago, only
used it once or twice, I beleive it is the ST version of the famous
Happy upgrades for the Atari 8bit 1050 d/d, I am just wandering how
much these item(s) are changing hands for, as I am looking to get shot

of mine as I don't have my ST/e anymore and I want it to go to a NICE
ST users home, where it will be better appreciated.

Please E-MAIL!!!!!..

yours Atarily

Depending on your hard disk driver you can prevent booting from your
hard disk drive by pressing the ALT key until the driver is loaded. You
can boot from floppy this way, then start the hard disk driver manually
from the driver disk and delete the offending program.

news:3C077025.94096858@forestmeister.com...

> I don't know. Should I plug into the "IN" socket?

Yes. As someone else has said, you MAY need to stuff a terminator plug in the OUT socket but try it without first as the drive in the box may already have internal termination set.

> But, what about the software? I have these 4 files files, Ahdi.prg,
> Shdriv.sys, Hdx.prg, Hdx.rsc. What do I do with them? I have no
> instructions. Do they go into the Auto folder? Do I run them?

Hmm ... memory is getting faint! The .SYS is the driver itself and should be in the root folder (C:) of the drive. If you run HDX you should find that there is a facility called Install which will write some boot code into sector 0 of the HD which will load the driver automatically on switch on.

First things first:
Get the cabling right so that the HD is recognised on power up.
Use the HDX util to check the drive is partitioned (otherwise partition it).
Use Install to make sure the boot code is in sector 0.
Install (from the desktop) icons to represent whatever partitions you have made on the HD (C:, D: etc.).

Outgoing mail is certified Virus Free.
Checked by AVG anti-virus system (http://www.grisoft.com).

Anyone know where I can find a C-Lab Export circuit diagram?

Also could I be emailed here?

daja300@aol.com

Thanks
Dave H.

```

I don't remember anyone on the list having an Akai DR4D but if you do, please let me know how you get your midi sync to work by playing the DR4D and being able to rewind to specific spot[s] in a song and having the Atari sequencer play all the midi devices rather than just from the start of the song.

In other words...

I hit play on the DR4D while it is in Midi Sync mode and it will in turn start the Atari and the Atari will start playing all the midi devices as if I started it from the Atari Notator start button. And if I rewind or fast forward to any section of the song, Notator will cooperate and make all the midi devices play in perfect sync with the Akai DR4D. I do not want to be able to rewind only to the start of the song or fast forward to the end but anywhere in between.

Thanks
Dave

```

Hi switchblade

| Hello - posted this originall to comp.sys.atari.st.tech but didnt get much
response.

| I have recently aquired a Mega ST 2 a Mega ST 4 and a 520STFM.

Lucky you.

| The two Mega ST's need a monitor, so have been unable to test yet.
|
| The 520STFM look like it has a newer TOS version than it should have (its
| copyright 1989, and the Atari logo scrolls lots of colours).

That would be Rainbow TOS, TOS 1.04 i beleive.

| Questions:

Shoot!.

| Can i use a ST monitor connector to SCART connector for the Mega ST's so I
| can view them on my TV rather than source a hard-to-find monitor?

You certainly can, however you must be aware that the "standards" for scart
are somewhat interperated, so you may have to get out the soldering iron to
get it to work, however the lead i used with my Mega STE worked fine after
some surgery on my monitor.

| Failing that, can I use a monitor like the commodore 1084s or phillips ?
| Would it come with the right connector or is the ST one proprietry?

The phillips CM 8833 was probably the most popular choice for an Atari
monitor and will work great with the correct connectors,   cant comment on
grannies comode-door.

| Can I still get the Atari 520STFM upgraded to 1 meg as it is only 512k and
| some games won't play?

Some Games will fail with more than 1 meg, carefull not to shoot yourself in
the foot, more memory will be great for word pro or art work.

| What are the Mega ST's worth nowadays?

They are priceless if you aint got one. 8-)

--

Regards from STEve & his nice warm cosy PAK'd MegaSTE.

An STFM would only ever have SIMMs if it already had a memory upgrade which handled them. If it's still at 1Mb RAM, then the answer's definitely that it won't have SIMMs.

Hello,

Can anyone here create a circuit board layout for the ethernet card adaptor that Thomas Redelberger has on his site?

http://home.arcor.de/thomas.redelberger/prj/atari/ethernea/index.htm

I'd like to have a some produced using this site.. www.pcbexpress.com so it would have to be in the format they require.

e-mail me at webmaster@atari-users.net if you are interested.

Thanks!
Rob

You must inform him so he can place the image in the archive.  I will but
please tell me how you want it laid out.  What sort of connectors do you
want on the board for the ACSI for example?  What power conenctor do you
want, as you need 5v IIRC and it some cases 12v.

>e-mail me at webmaster@atari-users.net if you are interested.

No.

>which works properly?

I got one from http://www.programmersheaven.com (link on my website).  If
you scroll down to 'other platforms' and then click ST hardware there is a
nice list of hacks.

Hi Axel,

>> No STFMS had simm sockets. All had space on the board for a maximum
>> of 1MB on the board. However the system will work with 4MB if you
>> attach it, be either a card like the Marpet Xtra which lets yiou use
>> simms (30pin) or by soldering a simm in. There is also Alt RAM
>> available with a Magnum card, this RAM is purely for programs, not
>> shared with the video so it is faster.
>
>What in you opinion is the best route and do you have a link for purchase/hack.
Thanks

Well, depends if you're good at electronics or not. If you do solder a simm it is just a case of wiring up some 30 wires. I looked at atari.nvg.org (I think thats right) and took the Stacy RAM hack and modified it for an STFM. There are other places this is described. Both give the same performance. If you don't like soldering then take the Marpet or Magnum. If you choose Marpet you're limited to 4MB but Magnum can do something like 8MB plus what you have. Not sure if Magnum is still produced.

I have here a working set: DMA-Bionet boxes on TT's and a MS-DOS
server.
The software on the Atari is no problem for me to find
but those MS-DOS stuff: I only got it in working condition. No
knowledge about wat is needed for what and how. I only type the
letters 'boinet' after de DOS-box has booted....

| > it up and rip off the metal shield?

| An STFM would only ever have SIMMs if it already had a memory upgrade
| which handled them. If it's still at 1Mb RAM, then the answer's
| definitely that it won't have SIMMs.

I've got one here that was "marpeted" just to go to 1Meg. SO that's that
rule off the bog wall.

That is what I was hoping to find :) -at least the manufacturer.

Btw. in what manner does a "handicapped" blitter manifest itself? Is it
something obvious- like that it doesn't work at all or messes the display,
or is it something more subtle?

regards;

Does anyone know how to detect, in software, whether the floppy drive is a 720k, 1440k or other? I know the _FDC cookie, but actually I want to know how to detect this without using any TOS services (or if you wish, how the TOS itself detects this.)

I understand this depends on the actual drive, not the controller. Is this right? Can the WD1772 drive a 1.44 MB floppy drive?

Laurent.

Thanks,

I never saw that on his site.

But as someone as already stated.. the layout isn't on the site. Which is what Thomas requires in the GPL (?) .

It would be great to have another Ethernet adaptor out for the atari.

I don't recall any TT upgrades besides the Catteraman(sp?). Has anyone ever
done a home brewed TT upgrade? I know of a few for the Falcon, 2 by Geir
�yvind V�lidalo. One is a FPU speed upgrade and the other is a DSP speed
upgrade.

what about over clocking the 030?

Hello,

I managed to get everything together, so the documentation for my HD module (which does auto-step even for 40-track mode, in case anyone still uses 5.25" disks :-)) is available at

http://www.ccac.rwth-aachen.de/~michaels/

Since I were at it, I have also put the files for a 2.5MB->3MB GAL up there.

cu
Michael

Yes, I've done one, but it will only work with a graphics-card installed.
I simply replaced the oscillator with a 40MHz one, and made a 500KHz clock
with the old 32MHz oscillator and a ripple-counter. I then fed the
Rx/Tx-clocks on the ACIAs with this clock. Just like on a Falcon really.

The problem with the TT is that - unlike the Falcon - it doesn't have a
separate pixel-clock, so if you change the system-clock the graphics modes
will be all messed up. This is why it only works with a graphics card.
I guess it's possible to work around this, but I don't know how.

You can purchase a brand new 68000 that runs at 16 MHz for US$7.52
(quantity: one) at http://www.digikey.com

Cheers, it's appreciated. That 40 track mode might come in use as I've
been meaning to press my SX-64 into life for years. I'll take a peek...

I've never looked into TT as I don't own one. My vague memories tell me
the TT has the CPU either acting on waitstates or has the speed switched.
You could get the CPU to work at 64MHz, but I would guess you'd need a new
CPU. Anyone want t give me a TT?? :))

Exactly the same problem with the ST. But I'm working on this for the ST. Djordje Vukovic gave me some schematics of some sync generators, this are simply fed onto the old syncs when you set the ST to use external syncs. If you revert to old syncs rates with faster pixel clock you end up with picture with wrong aspect ratio, could be pretty horrible. If you use a monitor that can accept faster syncs then you should be able to speed it up without having to worry about new sync rates.

I don't know all the sync rates on the TT but on the ST they are 37500Hz and 71.2 HZ for hi res. If you had ST at 48MHz then syncs would be 56250Hz and 106.8Hz. Nice, but the advantages of having a higher refresh aren't that noticable. I would propose regenerating syncs to 40000Hz and about 60Hz to get a 800*600 screen, the Atari monitors may be OK at these rates. Not sure, could end up with a blown HOT or whatever blows when you put wrong sync in.   Some re-jigging of where TOS places it screen buffer (would now be 60Kbytes) would be needed and setting up some enviroments so programs know the correct screen rez. I'm not sure on that part.

A quick look at the TT registers shows that it can accept genlocking so I see no reson why it isn't possible to do similar to a TT. Would sure be fast. Is it possible to stick waitstates to RAM and ROM on TT like the Falcon? When I speed my ST to 64MHz system bus I had to replace RAM and ROM.

For Motorla CPUs check out somehere like http://www.futurebots.com. I
looked in this Amiga freeware accelerator called Lucas, should work with
small fiddling to some address mapping in the GALs. I'm not interessted
in starting a huge project like that though. This is a possibilty of
modifying a commercial amiga accelerator, just seen one go on ebay for
about 15 dollars that included 1MB of fast ram.

Hallo Hallvard!

HT>According to the price-list/order page there's just about nothing for
HT>sale it seems....

Currently. The layout is finished, though. Drivers for STinG are available,
and AFAIK it's planned to start sales shortly. For the second edition with
the dedicated controller, Vassilis is busy writing the drivers.

HT>Besides, I like it when circuit layouts are available for free as
HT>well, so that those with some knowledge in electronics can build them
HT>while others can buy pre-assembled circuits.

Well, you may ask Elmar if he's willing to publish the layout :-)

I have no idea really... The RAM on my TT works fine at 40MHz, and IIRC the RAM/ROM-chips itself should be fast enough to cope with 48MHz too (which was the other oscillator I tried). Unfortunately something else (don't know what, MMU perhaps) choked on the 48MHz clock, so I settled with 40.

There is very little point in doing this. The caches on the 030 are so small anyway that the speed-increase would be insignificant. My

experiences with double-clocking the 030 in a Falcon are not good, there
is no perceived increase in speed.

```

Good I was going to ask this all important question, I have just finishing
repairing a MegaSTE, replaced a stuffed blitter socket. I cannot get it to
load Xcontrol at all, it just gives 2 bombs. I thort it could be the DMA
chip but not sure. Of note tho I used a blitter from a defunct MegaST as I
have misplaced the chip when I removed the old socket. However if I activate
the blitter on the desktop no problem. The main symptoms I am getting is 2
bombs loading general.cpx, random floppy cacking (I have replaced the WD
ic, to no avail), and garbage on screen like a CT2 without NVDI if you've
ever seen it. Not on the desktop tho all is well at that point. Also,
changed ram and Roms, had to try something. Could it be the old blitter????

I have 2 dead meagst's. If anyone needs the docs I will copy a cct diagram
this weekend (hopefully), just e-mail me, it is only a 1 IC patch.

Thanks

Mark

Hi group,

I recently purchased an Atari Mega STE with the standard 48 MB harddrive built in. Now when I start the Mega STE, the drive immediately spins up to normal speed, but after that, it takes one and a half minute before the bootloading of the drive begins. I measured the startup time of an Apple Mac SE/30 harddrive here too and that drive already boots after like 10 seconds. Could there be something wrong with either my harddrive or Mega STE or is this slow behaviour typical for this machine?

TIA,
Martijn

Yep,
that's right!
If you press any button after startup, the bootloading starts immediatly.
You probably don't even have to wait for the memory check to be finished.
Doei!

I just tried it and it works :-) Thanks for the explanation, guys. So it
isn't a problem, but a feature instead. Can this feature be disabled
somehow, because I don't see why anybody would want it?

Cheers,
Martijn

I takr it you've tried the PSU with a scope or something?  Other than that
it could be anything.  Problems like this can take ages to track.
Sometimes one of the most annoying things are when they almost work, if
they don't work at all chances are it's something not connected or broken.
Just like intermitent faults.

Hi all,

This questions are for the hardware "gurus" among you. It seems that the
Mega STE can use RAM beyond the 4 MB limit of the MMU if it is supplied in
the VME address space. Then a VME memory card could add up to 4 MB more
to the system. Of course, this RAM can't be accessed by the shifter and
then could not been recognized as ST RAM. Now the questions:
1. If I use a VME RAM card, do I need any driver to make the system
recognize the RAM as T RAM or it is done on the fly by TOS 2.06? I always
wondered why the boot test refered to the system RAM as ST RAM, just if it
were posible to find TT RAM in the system.
2. Do you know where can I obtain an VME RAM card suitable to work in the
ATARI?. I have only seen full size cards in the net.

Regards

I think that it is not possible. The boot delay was thought to prevent the machine to load TOS too early, before the hard disk was prepared to boot. At least, I have always believed this to be the reason and remember having found that written somewere. This was also present in TOS 2.05, in which there was no memory test as I recall, at least not the Fuji logo :-). With external hard disks and STFMs/Mega STs I had a lot of trouble due to old devices with very slow booting.

This feature is not really useful, indeed. It is basically meant to ensure that the hard disk drive has spinned up to normal speed before accessing it. A more intelligent solution would have been for TOS to check the drive status and wait only as long as needed. Unfortunately TOS is not this intelligent and requires the user to decide when the drive is ready.

But even old devices do not take more than a minute to be ready. It would not have been a technical problem for making TOS more intelligent and having it check for the drive status. This way the user would not have had to care about this issue.

That won't help then: you can only read 40-track (MFM) PC disks. The 1541
uses GCR zone-bit recording.

Yes. Basically, all the driver has to do is one call to Maddalt(), plus test
the memory if you want to.

>wondered why the boot test refered to the system RAM as ST RAM, just if it
>were posible to find TT RAM in the system.

It is the same code as in the TT, only it does not look for TT RAM in the
2.06 TOS.

Having used a Mega STE for several years I never found the boot delay to be a problem, how much effort is needed to press the space bar to cancel the TOS 2.06 memory test?

If you have TOS 2.05 swap it to TOS 2.06.

I seem to remember something about TOS 2.05 not showing the 8-16mhz switch in the control panel.

The delay gives you the chance to select your boot partition.

I would replace the Seagate 157 drive with a quieter drive e.g. a Quantum LPS or EPS, 500mb or so.

Best ST machine Atari produced, methinks. (in stock)

Hi,

Anyone ever scan in the Schematics for the TT030?? I know that the ST/STe/MegaST/MegaSTe schematics are all available but did anyone do the TT030 ones?

If not does anyone know what type of EEPROM's the TT takes for TOS?

When fitting EEPROM's in an STe you have to change some Jumpers depending on the type of EEPROM you are using. Does the TT have these jumpers? Where are they what are their number (i.e. U102, J12 etc.)

I was thinking I might be able to use 4x27M1001 (128k*8bit) EEPROMS that are in STe's?

Ok, that explains it all. Thanks to all who responded. (Btw, I just opened
my Mega STE manual and the feature is nicely described in there...no
comment, please ;) Is there an alternative TOS version that doesn't have
this feature? Not that I can't live with my current TOS, but I'm just
investigating.

I'm running TOS 2.05 and I do have a CPU speed switch in my control panel.

> I would replace the Seagate 157 drive with a quieter drive e.g. a Quantum
> LPS or EPS, 500mb or so.

Yes, that's what I am planning to do, but as I've read from previous
postings, the spartanic SCSI interface in the Mega STE can be quite picky
when it comes to accepting drives. As I understand, I can use drives <1GB
and without a bus arbitrary system, without having to buy extra hardware for
the Mega STE...?

> Best ST machine Atari produced, methinks.  ( in stock )

Agreed :)

Cheers,
Martijn

Hmm, I've heard that if you have one of these 5 1/4 inch drives on PC you
can stick Commodore files onto it to read on real Commodores. Is it more
a software issue of writing in a non DOS style format on the floppy?

What do we have computers for? They should think for us, be intelligent.
Being intelligent in this case means that the computers cares for the
drive to get ready, not the user. TOS is simply stupid in this respect.

> The delay gives you the chance to select your boot partition.

You would not need *this* delay for that. Even without a minimal delay
when waiting for the drive you would have more than enough time to
select the boot partition.

> I would replace the Seagate 157 drive with a quieter drive e.g. a Quantum
> LPS or EPS, 500mb or so.

Keep away from the EPS. They are really slow, even the slow ACSI/SCSI
bus of Atari computers transfers data faster than a Quantum EPS drive.

There were not really many changes. Actually instead of using TOS 2.06
it will make more sense to run MiNT or MagiC. MagiC in particular if you
want to speed up your system in general.

Sure, but given the fact that there are hardly any developers left and
even less know to handle ACSI/SCSI etc. I would not expect anything to

```
happen.

Just reducing or disabling this without actually waiting for the drive to be ready is not really a good idea. You would have to burn a new set of EPROMs when you want to change the drive, in particular if the new drive takes longer to get ready than the old drive. Note that if TOS accesses a drive too early booting will fail and a reset is required in order to boot from the drive.

Are they Foxconn, like most of the other connectors in the ST.

I think they might be custom, as 1.27mm or 2.54mm seems to be the usual types
available. They don't seem to be available on their web pages.

These connectors are known as "cardedge" types, they must have been available,
but popbably as special orders.

Would it be possible to modify an 1mm spaced AGP socket (use every second
pin), or a SCSI connector (2.03 mm centres). Or perhaps one of the Pentium
slot sockets.

No, but an ISA socket should work fine.

/Peter

I bought Scooter which is nice. I bought it from Peter West IIRC which
can converted to English with a nice fat English manual. It runs on any
Atari and clone and cost me around �50 or 150DEM. It is also available in
its native language, German. A demo can be got from chapelie AFAIK. It
works very nicely, I sometimes use it in black and white or 4 colours as I
can squeeze a higher resolution out of the Falcon this way. It also works
OK under multitasking.

If you use 2.54mm spacing sockets you'll end up shorting out the edge
connector and the fit will be very loose.  The 4.5mm I guess is measured
on the socket.  This is standard to all sockets as the sockets are
designed for PCB thickness which is about 1.6mm IIRC.

>Are these connectors really un-standardized?
>Were they custom-ordered by Atari?

Don't know, sorry.

>What puzzles me is that there have been several DIY projects involving
>the cartridge connector, so they must be (have been?) available as
>stand-alone components as opposed to having to unsolder them from dodgy
>STs. If someone could just tell me which company made them it would make
>it a whole lot easier tracking them down.

I honestly don't think they are made anymore.  AMP sell _lots_ of
connectors but I've never seen a 2mm pitch one.  Anyone else?  I'm trying
to remember where I saw a text talking about it, perhaps it was included
on a hack on Vezzs site, possibly the one about the cartridge port.

Hmm, never heard of that one, but I know that Maxon made a lot of Atari
hardware stuff so it's comes to no surprise :)

Eagle is a PC program, and IIRC R.Czuba uses it for the CT60 design.

Hi Hallvard,

> Wow! That's impressive, and of course very practical.
Yes, and although the program is old, it runs very well under GEM.

> ...and only available in German?
Yes, I think so.

> How much do these packages cost?
Don�t know if you can buy a new one, I had bought a second hand version
at Peter Denk Fachmarkt

http://www.atari-fachmarkt.de/

perhaps he can help you to get one.
I paid about 80 DM for it.

Ciao

Marc-Ant�n

I am ignorant of the bove matter, but I foun the following, which I trust is helpful.

From "The Atari A-Z" by Mark S Baines (1995, revised later):

CARTRIDGE   A cased circuitboard with 128K of Read-Only Memory plugging into the cartridge port of the ST-Falcon range enabling instant program access and using no main memory except for the program's data. Some cartridges do not contain program ROMs but are just interfaces for other devices, such as scanners or contain audio digitizers and samples. Others are used as a security dongle especially in the MIDI music world and battery-backed clock cards are popular. A computer diagnostic cartridge is available for techicians wishing to analyse hardware problems in the computer. Apart from Computer Concept's BackPack and FaST BASIC cartridges, the port never caught on for programs due to the small memory size available and the extra cost. A port device can be installed on the Desktop as drive c: (lower case 'c') and treated as a normal drive except that it cannot be written to. The port is a 40-pin 2 mm spaced doubled-sided PCB edge connector. There is provision for two 64K EPROMs in the address space $00FA0000 to $00FBFFFF. The port supplies power at +5V at pins one and two (at around 300 mA) and there are sixteen data lines, fifteeen address lines, two ROM select lines and upper and lower data strobe lines. There is no read/write line so that no attempt can be made to write to the port.

A bus error results if one is made. (The port can be written to in a limited way by having a program map data onto the address lines.) All lines are not buffered which can result in expensive damage to the computer if a current is placed on the wrong lines. Some ST cartridges will not work on the TT or Falcon for varioous reasons. Some use bits 24-31 of address resgisters for internal information for the application. As the TT's MC68030 uses 32-bit addressing this causes a crash. Another reason has to do with timings. Some cartridges fail because the ROMs and other components have access times that are not fast enough for the 32 MHz 58030. Others fail beacause they caoount on the timing of byte wide reads to the cartiridge port to be that of an 8 MHz 6800.

Charles.

Which one - 1040STE or MegaSTE?

For a MegaSTE: MagnumST for more RAM.

For both machines, the only CPU upgrade I know is a PAK-3, possibly with the additional Fast-RAM card. However, getting them to work in a STE requires a PLCC->DIL adapter for the CPU socket, and the whole tower of PCBs yields a quite delicate construction.

Not really.

In that price range, you are better off not using the auto-router. Even in
the 10k+ price range, I have yet to see an auto-router that really gets in
the vicinity of a manual layout.

No, that seems to be an ISA connector, but as some other poster has already said, the ISA connector might work.

I think the difference is quite significant, 2.54 mm vs 2 mm (approx).

I'll have a look at some various connectors & see if there are any suitable. Unfortunately, I have no Atari ROM port products, so I can only compare the cartridge port on the ST to the connector.

It's no big deal to get custom connectors made up, especially if you are are ordering thousands. The problems begin when the production runs are finished & the product (ST in this case) is no longer produced, it becomes almost impossible to get the parts after a while. I doubt FoxConn would be interested in making them again.

I am sure there was some inventory left over after Atari ceased ST production, but was it sold on, or was it junked - who knows?

In the past, ST users have manufactured their own hard to find connectors (the ASCI port one) by cutting up RS232 25 pin connectors & bending the metal into shape/filing away the unwanted material.

The 19 way ASCI connector is actually available, as is the floppy disk & monitor socket from Maplin, in the UK. I do not think they have the cartridge port though.

I think there is a good possibility the SCSI DB50 connector (female version) can be modified. It looks about the right pin spacing,being 0.85" (2.1 mm).

It would need to be cut lengthways, then filed down until the spacing between the upper & lower parts is approx the thickness of a piece of circuit board material (is that 1.6 mm or 1.2 mm, I know SIMMS are thinner than normal).

Hi Hallvard Tangeraas

> What are the various options when it comes to accelerating an STe and
> expanding memory above 4 MBytes?
> Pre-assembled or DIY projects from circuit diagrams etc.

The PAK and FRAK projects were available is DIY kits, along with the PCB's and neccessary GAL's. try a search for MWcomputer.de. This would give you a 40Mhz 030, an optional FPU @40Mhz and a potential 128Meg of TT RAM.

Regards from STEve & his nice warm cosy PAK'd MegaSTE.
* MegaSTE 40Mhz 68030, 68882 FPU, 4+16 Meg RAM, SCSI II, MV-300 *

Ooh!, what a coincidence, but I bought mine ready built when I was much better off. 8-)

Here's a clip from the Readme of an APP called CLA, I have no idea as to its current evolution but suggest this may be all you need anyway if used in conjunction with Scooter as mentioned by Peter West.

-------------------- Clip Start --------------------

CLA v3
========

This is the sixth beta release of the CLA3 electronic CAD system, and the first general release. This release is just the schematic and simulation sections (as far as I've got).

Anyone who has seen CLAv2 may be a little shocked by v3, as it is a total re-write from scratch. Some features of v2 haven't made it into v3, but the editor is a vast improvement over v2 (well, it should be, I've spent a year or so on it). The simulator lacks some of the v2 features (interactive mode is the big one), but tries to make up for it

by being easier to use, and providing larger stimulus (the window now
scrolls).

If you've not seen v2 (and I hope everyone forgets about v1), you
should be in for a treat - CLAv3 aims to be a 'real' EDA system,
so it provides hierarchical designs, libraries, multiple windows, GDOS
printing, simulation, auto-routing, and lot's more, all wrapped up in
a DULIB GEM interface (windowed dialogs, AES4.1 support, colour icons,
etc).

-------------------- Clip end --------------------

I agree, there's no harm in direct help like this and I encourage it, its
multi page spam I disagree with.

A past flame war in here has resulted in more discrete, albeit public, but
targeted solicited replies which I have no objection to at all, in fact I
would encourage this "Stealth-reply" technique.

** Stuff deleted about CLA **

CLA is really a logic simulator, a good one, as I used the beta years ago to design an ST CPU speed switcher. I think it's unsupported now, as the programmer went on to bigger & better things.

AFAIR, it did not have any layout facilities, it did not have the full range of electronic symbols, so it's not great for drawing schematics either.

Still, it is a great package, very useful if you want to model simple logic circuits & see the effect of changing the inputs.

I think he meant PCI which is I think 2mm. From searching the web it appears that at some point in time there was a push to switch from 2.54 mm (i.e. 0.1 inch) to 2mm, but that it was failed. There are a number of places where 2mm connectors are mentionsed, but as has been stated before, these no longer seem to be available.

If you ever lay your hands on any such software (on any computer platform),
don't be surprised at the stupidity it will show in autorouting some
quite simple layouts.  In my opinion, the designer is the best router.

This seems very similar to the concept which I contemplated recently- even made some schematics which I didn't test in practice :) i.e. decode the upper three address bits in order to redirect CAS lines to additional banks (RAS lines being common to all).

My idea was that, since the shifter AFAIK must access RAM at a fixed 500ns pace, a 2MHz signal, synchronized (but slightly delayed) to system clock, could be used to decide whether the Shifter or the CPU (or DMA) has the right to access the memory. Brieflly: if the circuit finds that AS is asserted on the beginning of a 250ns half-cycle then access to the alt-RAM would be granted, and it would last for 250ns. The second 250ns half-cycle would be given to Shifter in all cases, and access to alt-RAM would be disabled (delayed until the next 250ns half-cycle). It seemed to me that about 10-11 TTL chips would be needed for a 4MB ST-RAM + 10MB Alt-RAM configuration. How about this?

I wanted one of these and actually found this software, it was from the guy who wrote XaAES before Henk took the project over. I tried it on my Falcon but all the icons were messed up and colours were wrong. Perhaps I should try it my the STE. Hmm, it sure looked promising for me. I know it ain't going to be able to kill some of the logic simulators on the PC but for simple stuff it'll be nice. IIRC it had source code available for Lattice C but I doubt I could do anything useful too it.

OK dude, it was a very old version I had and the readme did talk of
progress, I was wondering if any current version that existed might have
done what Hallvard required.

Hi;

It has been mentioned several times here that some MegaSTs had a

piggyback board on top of the CPU in order to mend a fault which
appeared in a batch of blitter chips. Is it possible to identify
such faulty blitters by part number or name without actual testing?
The purpose of the question is to be able, when possible, to remove
the piggyback board (and reconnect traces on the motherboard) from
a machine in which the blitter has been changed.

Thanx;

Chips and Chips has information on how to do the modification
(including a flip flop) but doesn't tell you which chip to do the
modification on. I thought it was all external blitters weren't that
stable but perhaps this is wrong?

Hi

I recently bought a 68HC000 for my STFM. I plugged it in and everything is OK. The problem is it seems extremly picky on the clock signal. If I take pin 15 (clock) out of it's socket and take a wire straight to an 8Mhz point on the board the machine doesn't boot. The only way I got it to boot was placing a small (22pf) capacitor from it to ground.

I then built myself a nice clock switcher that switches when both 16 and 8 MHz go high to stop spikes. I tested it on an old STFM with its orignal Toshiba NMOS chip which is rated for 8Mhz. It ran great, managed to run Gembench and it was still working an hour later after looping through a game demo. So I went to put it on my other STFM with the HC CPU and it won't work. I've tried to fiddle with capacitors in various places but no go. Any one have any ideas, perhaps I should be trying comp.m68k?

I thought the HC would be lenient on the clock switching as I've heard it is made in static design or something like that where it can be ran at 0MHz. The STFM with HC does have F rated bus drivers but I don't see why that would cause the problems.

Yes, I agree completely. With Scooter-PCB you can let it
autoroute some or all of the connections from a net list
that you can put together fairly easily from a circuit diagram,
though it is laborious for large PCBs - you have to number each
pin or connection of each component and then write a series of
logic equations for each connection. In general autorouting tends to
use far more vias than a competent designer would do.

BTW - I originally posted my reply in comp.sys.atari.st but somehow
the whole thread seems to have been copied to comp.sys.atari.st.tech
and the same goes for a number of other threads in these topics.
Is this deliberate or is something cross-posting the messages?

Regards, /Peter/

I recently acquired an Atari Megafile 30 HDD. When I attach it to my 1040ST (which has two FDDs) via the 19-pin cable, the ST does not recognize the FDDs or the HDD on boot up. Do I need a special boot disk and/or software to configure the ST to have HDD capability? Where can I find information about this, as my manuals are vague and confusing, inferring that the ST should automatically see the HDD.

I appreciate any assistance.

Isn't the 68HC000 a microcontroller, rather than a CPU? Why would you use it on an ST (to replace/augment the stock CPU) when it may be less capable/powerful than the stock 8MHz 68000? However, if you're trying to create that "Mini ST" based on it, so that several of the ST's functions are onboard the one chip (serial, clock, memory, etc.)... THAT would be a cool move... provided that TOS, MiNT, or MagiC, etc. would accept it.

No, it's a normal 68000 but based on CMOS technology (as oppsoed to NMOS)
and is also less hungry on power.

All hard drives require some kind of driver. Normally this is loaded on the
hard disk,
and gets loaded when the system boots. I seem to recall that you need to
power up
the hard drive first, and wait for it to spin up before you switch on the
ST.

There should also be a utilities disk to allow the drive to be low-level
formatted,
partitioned, and high level formatted.
For a Megafile 30 I would have expected some version of AHDI.
You can download AHDI from http://www.umich.edu/~archive/atari/Diskutils/

when you say it does not recognize the FDDs or HDDs what do you mean?
Does the system hang?
Do you get a blank desktop, or one with missing items?
A desktop with icons for several drives which produce errors when you try
and open them?

If you are just missing ICONS have you tried Options -> Install Devices.

> Where can I find information
> about this, as my manuals are vague and confusing, inferring that the ST
> should automatically see the HDD.
>

I would assume that there was some kind of manual with the megafile.
There is a little information at
http://www.atari.org/hosted/quickfaq/stfaq_3.htm#2

> I appreciate any assistance.

Thats o.k. However I expect that the Megafile has a duff drive in it.
If so I don't think there is any thing you can do, as I think the
megafiles had a ASCI->MFM interface, and an MFM drive.
I think it would be difficult (and possibly expensive) to obtain
a replacment MFM drive and because there is no SCSI in the
drive you can't upgrade to a SCSI drive.

Folks,

I have an ATARI to SCART lead which works fine on my Phillips CM8833
monitor. However when I use it with any of my TVs which have SCART I only
seem to get a very dark monochrome picture. I assume this is because
somthing from the ATARI is fooling the TV's into thinking thye SCART is
sending composite.... Any one any ideas...

Dave.

Computer Displays mostly use R, G, B - Signals. (Also H- and V-Sync)
TVs most use Composite Video only.
(RGB and Sync-Signals all in one Signal)

Result is what you have seen on TV.

Try to connect your Atari via Composit Video to TV.
(Watch NTSC / PAL mode)

Regards, Robert

Both my TV's implement RGB (well acording to the hand book) on the SCART
ports I am using.
In fact I momentarialy see a good picture as I power up so something is
setting the scarts to
composite mode. Is there a line on the scard to switch between composite and
RGB?.

> Try to connect your Atari via Composit Video to TV.
> (Watch NTSC / PAL mode)

I can do that but COMPOSITE yeilds a really grotty picture. Its o.k. (just)
for games...

>RGB?.

Yes, there are a few "control" lines carried on the SCART connector, best

to look for the pinouts. Unfortnatly the standard has been confused on the control lines and some are used for wrong purpose, some are conencted to 12v and some to ground. I'd look for these pins and look in your adaptor cable and cut the wires going to them. For example, one control line switchs from TV to AV/SCART mode.

Hi

I've recently acquired a Seagate ST32155N hard-drive (specs below) to replace the old 40mb Seagate running inside my 4mb Mega STE.

http://www.seagate.com/support/disc/specs/scsi/st32155n.html

I've disabled parity using pin 4, but HDDriver still doesn't recognise the drive.
Pins 1 & 2 deal with "Termination Power-source" do I need to set these jumpers for the drive to be recognised ? Or am I doing something else wrong ?

Regards

Phil Graham

Hi

Just to say the problem with my HC chip seems to be sorted (thanks
Djordje). I tried capacitence across the clk line but it didn't seem to
stable. I then tried buffering it with HC TTL but still not improvement.
I then tried a resistor in series with the clock line as used on the DRAM
control signals as suggested and it worked great, even my clock switcher!
Don't know why it needs it, soemthing to do with impedance?

Damn thing runs too cool, I wanted lots of fans :)

Does your TV have switching for the AV input for different types
of signal? My Sony toggles between composite, S-VHS and RGB using
a single button on my remote. It may also be the auto AV-switching
signal, which on the Atari is +12V on pin 8 or the SCART; try
disfonnecting that lead.

Just a question, do any of the 1040STFM models use SIMMs, or is it just
limited to STEs.   If the STFMs are split between individual chip RAM
and SIMMs, is there a way, by serial number, floppy bezel, whatever, to
check without having to go through the trouble opening it up and rip off
the metal shield?

Thanks.

It does not apear to do this. There are two scarts and a composite input.
One scart
supports RGB & Composite, One Composite only. All I can do is toggle between
inputs.

>It may also be the auto AV-switching

No STFMS had simm sockets. All had space on the board for a maximum of 1MB on the board. However the system will work with 4MB if you attach it, be either a card like the Marpet Xtra which lets yiou use simms (30pin) or by soldering a simm in. There is also Alt RAM available with a Magnum card, this RAM is purely for programs, not shared with the video so it is faster.

It is, most blitter chips work fine without the extra patch circuit - IIRC, only one (the first?) series by one manufacturer required it.

Hi Grazey

| I've recently acquired a Seagate ST32155N hard-drive (specs below) to
| replace the old 40mb Seagate running inside my 4mb Mega STE.
|
| http://www.seagate.com/support/disc/specs/scsi/st32155n.html
|
| I've disabled parity using pin 4, but HDDriver still doesn't recognise the
| drive.
| Pins 1 & 2 deal with "Termination Power-source" do I need to set these
| jumpers for the drive to be recognised ? Or am I doing something else
| wrong ?

I use a pair of 4.5 gig Seagate's with my Atari MegaSTE, I have parity set to off, terminator set to off, and trmpwr source to onboard on each device. . You didn't mention what you're using for a SCSI interface, if you're using the link it will need trmpwr from an external source. Terminate only the end of the chain.

|
| Both my TV's implement RGB (well acording to the hand book) on the SCART
| ports I am using.
| In fact I momentarialy see a good picture as I power up so something is
| setting the scarts to
| composite mode. Is there a line on the scard to switch between composite
and
| RGB?.

Pin 8 on the scart is the external switching input for composite mode, check
if the Atari is connected to this pin.
I made a lead once that used the +12v out from the Atari monitor din to
force monitor mode on the TV, its possible this lead is the same. Some other
'standards' use another pin (fast hblank) as i recall which will asert RGB
mode once pin 8 is also asserted.

Hi all,

Does anyone know what are Atari scan-codes returned by PC keyboard
adapter to Atari for the extend key Left Win, Right Win and
Application ?

Thank in advance
Laurent

Hallvard Tangeraas <northstar2010@______yahoo.no> skrev:

: Just found something interesting in my software archive!!!
: Have a look at the two following files I've just uploaded:

:  http://home.c2i.net/w-392864/atari/DIY_UHR.ZIP
:  http://home.c2i.net/w-392864/atari/ECHTUHR.ZIP

: It describes how to make a real-time battery-backed clock using a GAL
: chip and some other components. One of them is simpler to make than the
: other. I have no idea how they work, but they seem to roughly resemble
: my already installed "Mega clock" which I bought assembled from an Atari
: dealer years ago.

All right, but how many of us have the capacity to burn GALs?

: The "Areal 3.7" file describing how to use a Dallas clock module is
: probably OK, but I'm a little concerned about not being able to change
: the clock battery as it's inside the module.
: The above seems like more permanent solutions.

Usually it is possible to change the battery in those integrated modules.
You'll just have to be careful, using a file (? Du vet nog vad jag menar,
Hallvard =) to remove some pieces of the casing.

On a related topic, I've found a lot of Motorola 68 series support chips,
such as 6821s, 6818s and 6868s. Some of these are supposedly clock
modules. Wouldn't it be possible to interface one of these to the ST's
68000 architecture and a battery?

>Application ?

I don't think they are transmitted as a "special" code, I think they're
mapped to operate as other keys. So if you pushed the Windows key it
could do Help or Undo. This is programmed into the Atari-PC
microcontroller.

Hi,

My Megafile 30 is not responding anymore and I suspenct the cable to be

broken. Does someone has the wire diagram for this cable so I make a new one
and test it again?
The problem is: when I start the system, without the megafile connected but
with a diskette inserted I get the GIU. When I start it with the Megafile
connected, I get the same GIU. I can not see the hard drives I once
partitionned and formatted. I used this system some years ago for the last
time and It was working perfectly. Now I donnot remember anymore how this
TOS worked.
Could someone give me a hint please?

Thanks a lot,

Jake

Hi Jim!

>If someone has a cartridge clock, will they please try it with areal37 and
>report?

Yes, I'll try with the Forget-me-Clock which I have. I'll report back
soon.

: >the clock battery as it's inside the module.
: >The above seems like more permanent solutions.

: I just got them but they look quite complicated for what should be quite

: easy hack. I only looked for a couple of seconds but it looks like you
: need to patch TOS to look for the time at a certain address. My
: Forget-me-Clock uses a Dallas DS1215 which uses an _external_ battery
: (cell actually) and a small crystal (proabably 32.xxKHz).

Try running the program! Try reading the documentation! Areal37 will look
for clocks whereever they may be, and no patching of TOS is required. In
programming terms, one sends a test string found in the Dallas data sheets
to a possible address, which for Atari is the low address in each 6, 4 or
two ROM chip sets, and the cartridge address, and see what answers as a
clock. Not hard, to a programmer.

: TBH, I'd really like a rugby time module but they seem very expensive yet
: the clock versions are only about �20. I know Conrad had/does have one
: but I couldn't find it on their site. There is a special CPX that reads
: the time by a spare serial port.
: --
: Lyndon Amsdon

If one is in radio range of Germany, Conrad's products are just wonderful.

I am not, at the frequencies involved.

Well, the Forget-me-clock should work with Areal37 then but at the moment
my ST's are in repair/upgrade stage. I will try it on the STE though
it'll take some time as the cartridge port is internal inside the Tower.
The ones mentioned by Hallvard maps the RTC to $FFFC20 which is where the
RTC is placed inside the Mega ST.   If you're running TOS >1.02 then it
should pick it up without software, as I believe the Mega works like this,
or I should hope so!!!

I can't read German but there is something in one of the archives above
that suggest patching of TOS is required. There is a folder called
"TOSPatch". I would go for the DIY_UHR as this doesn't seem to require
modification to TOS or programs run in the auto folder. If the RTC is
mapped to the low address of the ROM doesn't the ROM contents and RTC
contents conflict?

Hi Varley!

>I have a dead ST.

What happens when it is turned on, does the power LED come on, does floppy LED come on? What appears on the screen?

>Tracing the address/data lines lead me to a chip labled
>GLUE on the schematic. GLUE? What's that?
>Thaks for any info.

OK the GLUE is used as an address decoder and anything else that needed to be put in there. It works together with the Shifter and MMU to put out the screen data, it infact makes your hsync/vsync for the monitor.

It also divides the 16MHz signal down to get other frequencies, eg 2MHz for the YM (Yamaha soun chip), 500KHz for the two ACIAs (UARTS for Midi/Keyboard) etc.

The CPU (68000) actually generates the address which is put onto the bus. It flows into the GLUE which will look at the address and decide which device is being accessed. It'll also generate the DTACK when a device is being accessed that isn't Motorola specific, eg YM. It'll also generate a BERR if there is nothing at that address space.

It's a stone! The power is OK, I checked it with a meter- in circuit, the
power LED is on.. The floppy does not spin and the monitor remains black.

Brief history...
Before the 1040STfm died completely it started to mess up my ICD attached
Syquest EZ135 disks. Totally corrupted them. At first I thought it was the
ICD. I don't think that now.
Thanks for the info Lyndon.

You have multimeter, but do not sound as someone who has a scope...

Can you check potential of the pin 17 (HALT) and pin 18 (RESET) on the CPU?
Reset should be low for about half a second after powerup and then go high.
HALT should behave similarly as RESET, but if something goes wrong (like
during RAM test) CPU "halts", that means HALT goes low and stays there,
while CPU is, well HALT-ed ;O)

Other possibilities might be dead DMA channel chip, oxidation on sockets
(reseat all chips) etc...

Regards,

Branko

Hello

I've been using my IOMEGA 100mb SCSI ZIP drive with my Mega STE with no problems. I have the ICD Link 2.

However recently things have been acting spookily!

When ever I write to a hard disk partition I get the message - "Daten auf Diskette in Laufwerk E: eventuell defekt" (i've got German TOS!) this translates to " data on diskette in drive E: possibly defectively ".

I've tried reformatting the ZIP disk but no matter how I partition the drive I get the same error (using HDDriver 8.03). I've done a sector test using HDDriver and it find no errors. I've formatted other ZIP disks and the same thing happens.

I assumed it must be my ZIP drive that was faulty but when I connected it to my PC it worked fine.

Any help appreciated.

Phil Graham

I did all the basic stuff when I first started to work on it.... reseated all socketed chips, disconnected everything not needed to boot etc. Still no change. I used the scope on the RESET and HALT lines. They behave as you've suggested though I'll recheck the HALT line and see if it goes low after about 10 seconds. There could be something wrong with the memory I suppose. Eight years ago I installed 4Meg. The CAS and RAS lines appear to be active.
I appreciate the help!

You say you have 4 Mb, which means two banks. Are all RAS and CAS signals active ? If so, that means that TOS thinks there is nothing wrong with RAM, which is not neccesarily true. If you have a scope, check all the controll signals on DRAM with it. Theoretically, you would need digital scope for it, but shorted address lines shows nicely on analog one as horizontal lines at cca. 2.5V. When two adresses are shorted, and they pull to the oposite directions, resultant voltage will be stuck somewhere in the middle in the "gray zone".

Otherwise, try exchanging DMA chip just to see if during your play with Link
poor DMA had bit the bullet. BTW- you don't have Link inside while
troubleshoting, do you ?

Try a different SCSI cable?, has termination been switched off by accident?.

I learned that today. =)
Glue logic is the complementary lpogic inside a computer which connects
any major parts (CPU, buses, memories, I/O) together. In other words,
address decoders, refresh circuits, buffers, and so on.

This looks like a termination or cable problem. As you said that it
worked fine until recently, something must have changed that in your
hardware setup.

I haven't done it, but Michael Ruge's contribution on this theme
in Chips 'n Chips 500 and X translates roughly as follows:

~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~
   There is a heap of complaints about the loudness of the fans of
   the ATARI hard disk as well as the computers (MegaST, MegaSTE,
   TT030 and Falcon030).

   Those who want it simple (and can live with it :-) ), break the
   RED lead of the supply to the fan and insert a 33 to 47 Ohm
   resistor; a 47 Ohm pot or trimmer will also work. Those who
```

want to be certain can take a somewhat better way and solder in a voltage regulator of the type 7808 (fixed voltage regulator for 8 volt); if necessary the type 78L08 version will do, as the fan in any case does not draw the 100 mA that the regulator manages.
In addition, to reduce the flow resistance of the airstream, it is recommended to remove the plastic strips covering the fan housing with a sharp craft knife (Careful: Danger of slippage!)

Warning: Before opening the housing remove ALL cables, including the mains cable that goes to the power socket!

Don't forget to insulate the soldered joins:

Resistor: A bit of heatshrink or normal sleeving

Regulator: A bit of heatshrink sleeving or insulation tape

Fan control: The best solution is to use double-sided tape to
(SEE BELOW) attach it to the PSU housing (MegaSTE/TT030/Megafile 44) or use a short screw to fix it to a mounting hole of the fan (M3 or self-tapping screw); only possible for hard drives SH205, Megafile 20, 30 and 60. With MegaST and the SH204 the wire (providing power) has to be lengthened so that the fan control board can be mounted safely. With a Falcon 030 the PCB can be positioned freely.

Connections for voltage controllers of type 78L08 and 7808

```
                 -------
                 |     |  <- This is where the type (7808) and
                 |     |     the manufacturer's name is found
                 -------
                  | | |
                  | | |
                  | | |
                  * * *
                  | | |
Input   ----------| | |------ Output
Red lead coming     |         Red lead going to fan
from the PSU        |
                    |
                    |
Ground  ------------| Connect this pin to the black lead
```

* Note: The Fan control is not otherwise referrred to in the later C'nC versions, but the early 180 followed the above with:

Or if you are really chosy and want to have things really easy can build in a fan controller. With the fan controller supplied by ELV you can set both the highest and lowest rotational

speed. However this fan controller is only available as a kit,
so you need to be able to use a soldering iron to build this
circuit!

Complete Silent-PC kit
Order number 10757   DM 16.95 plus post and packing (at the time!)

ELV GmbH
Orders:
Telephone 0491/600888 (+49 and drop leading 0 from abroad)
Fax   0491/7016
Modem   0491/7091
26787 Leer

(Translator's note: This may no longer be available, which is
perhaps why it's been omitted in later versions of C'nC. But it
should not be too hard to devise a suitable circuit, using a pot
to vary the base voltage of a regulator whose output goes to the
fan. A thermostatic control would be even better!)

On my qwertyx adapter it is user-configurable (in fact every key can be remapped). I don't know what other systems use.

http://www.seimet.de

Yes, there's been a rather major change in my hardware setup. I recently acquired a 2mb Mega STe, that's when the problems started to occur. I've just set up my old 1040 STFM and the ZIP drive reads/writes fine.

I remember once reading that some STe's had bugged DMA chips, could this be the problem with my Mega STe ?

Regards ,
Phil

Do you have the circuit available as a JPG or GIF file?

It sounds like something that would be VERY useful in a lot of applications..!

Hmm. In your first posting you said there were *no* problems with your Mega STE:

> I've been using my IOMEGA 100mb SCSI ZIP drive with my Mega STE with no
> problems. I have the ICD Link 2.
>
> However recently things have been acting spookily!

So it was not recently that something went wrong but the Mega STE has never worked at all?

>
> I remember once reading that some STe's had bugged DMA chips, could this
> be the problem with my Mega STe ?

No, because this problem was only relevant for some 1040STE, but not for
the Mega STE.

"Uwe Seimet"

> So it was not recently that something went wrong but the Mega STE has
> never worked at all?

It did work on my Mega STe only a few weeks ago. I think you may be correct in that it's a cabling fault. My ZIP drive fell off my desk at about the same time, I think a couple of wires going from my Joystick port to the back of the ZIP drive may have been broken.

Does anyone have the wiring diagram from the joystick port to the back of a SCSI ZIP drive (I've lost the original documentation).

Cheers

Grazey

Hallvard is this temp fan schem for the Mega4 Ste or does it matter? And can it work on a Megafile 20/30?

And is this Hallvard the owner of Notator.org? Don't sound like it but just
checking.

Dave H.

Hi all;

In case anyone likes to scavenge for Atari-compatible parts in heaps of
discarded electronic equipment, I have noticed that old Digital's
terminal servers DECServer 200/MC contain 10MHz MC68000s in 64-pin
dual-in-line package, nicely socketed for convenient extraction...
May be conveient for someone toying with ideas of upgrade hacking.

Cu.

Various ideas were mentioned here on the subject of reducing or removing fan noise.

But, are you sure that all this is good to do?

* I am inclined to think that the grille over the fan would in fact muffle the noise somewhat, not increase it, so removing the grille may have the effect opposite to one desired.

* AFAIK (at least some of) the fans have a miniature blob of electronics inside, to control the brushless DC motor in the core. I am not sure that this electronics would like very much to be supplied a reduced voltage.

* If the thermostatic control circuit turns the fan on/off intermittently this may, respecting Murphy's law, result in fluctuating temperature in the computer box. This is in fact a closed-loop-control situation and I suspect that a mistuned loop may even, if one is unlucky, result in larger temperature swings than in the "uncontrolled" variant. Btw. temperature cycling increases fatigue risks in chips and solder joints.

* The fan uses 12V DC. This creates a (small) load on the power supply but this load may be neseccary for the power supply to operate properly (especially if one tries it out of the computer). I think that I have read somewhere (Chips'n'Tips maybe?) a warning against this situation, and that a resistor should be substituted if the fan is removed or switched off.

>I just tried this, but the fan is still very noisy!
>It seems like the fan itself is of a rather bad quality so it might need
>changing

This seems to be the best starting point! Cooling fans DO become noisy after a while on a quite regular basis, and need replacement. They are, in fact, expendables. They also need an occasional cleaning because the accumulated dust may cause imbalance which causes additional noise.

Oiling the shaft of a noisy fan with light silicone oil may reduce noise for a while, but this should be considered a temporary measure.

Small cooling fans tend to come in two form factors, say "thick" and "thin", e.g. the fan fitting for a MegaST come in about 10mm and 20mm thickness. I would suggest using the thicker fan because the distance between shaft bearings is wider, and the loads caused on the bearings by residual dynamic mass imbalances are smaller. I have used twice on my MegaST the "thin" cooling fans and their life was not very long before they became noisy. Then I found a "thick" fan and it lasts here for a long time now.

Regards;

yes thats a good idea. Old macintoshes that arent working or repairable may yield a few usable parts too. I've even found some electronics shops where I live that have processors up to the 68030, and plenty of 6502 compatible stuff that could easiliy be atapted to 8bits as well.

I don't know if the ones I found were the same, but I got 3 for $5, and they had 10Mhz 68000's in them, but they had gold pins and had a ceramic case with a gold square in the centre. I toyed around with these and plugged straight into my st and into a friends Amiga 500. worked perfectly, these machines were also a great source of 12V fans for my pc.

> that this electronics would like very much to be supplied a reduced
>voltage.

The electronics serve to switch the field polarity of the coils, so that they are constantly being repelled from the surrounding circular magnet. The magnet has N-S-N-S poles, and a Hall effect sensor detects the change of magnetic field and thus allows the coil switching to be correctly timed. The coils are fixed, so the magnet and thus the fan blades are forced to rotate.

As you say, the fan won't appreciate too little a voltage, it will simply stall or just not start. I'd favour pulsing it on and off, varying the on/off ratio to vary the speed, or a 47R or so resistor in series with it. Too small a pulse or too high a resistor and it won't start.

Spending a bit of money on a good quality fan will help, a proper ball-bearing one will surely bring its own rewards :-)

Hi Hallvard,

>The problem of course if finding one with jumpers to select between
>drive 0 and 1.

Isn't it possible to put a twist in the cable such that the drive 0 and 1 select lines are crossed over? I think you can also buy cables with such a twist.

Hi,

I am looking for an IDE cable in my Falcon030.
On 1 side it has to be 2.5" ide and and then 2x 3.5" ide connectors. I have seen such a cable in the past, but I can't buy them anymore. Can somebody help me, I have a Falcon030 in desktop case now and with such a cable I can

connect the IDE cdrom player and Harddisk I have overhere....

I just got a 68HC000P16 shipped in from America and it is also in DIP, I was expecting PLCC so that's even better as I would of otherwise made an adaptor. Just placed a socket in so far, not checked it.

Actually, "Master" and "Slave" are terms which only apply to IDE hard drives, not floppy drives.

The settings on a floppy are Device 0 or Device 1.

(No big deal, but you'll only confuse any tech people at a store if you ask them how to set a floppy drive to "Slave".)

Unfortunately, as you say, ALL 3.5" floppy drives available today come pre-set to Device 1.

Also, as you've noted, most drives no longer have any convenient way to change the Device setting because no one ever used it anyway, so manufacturers simply stopped spending the money on jumpers, headers and circuit board real estate to support the easy changing of Device numbers.

The ONLY sure way to know ahead of actually purchasing a drive (assuming you don't find a store that will let you rip one open), would be to obtain the data sheet for the drive from the manufacturer.

I haven't looked specifically for floppy drive data sheets, but most hard drive manufacturers have this information easily available on their web sites. It comes in very handy for the occasional obscure brand or model whose jumpers are hidden or not marked.   If you're lucky, similar info may be available for floppy drives.

Failing that-

You've no doubt seen the floppy drive cable on an IBM compatible system with the "twist" cut out section of cable.

The "twist" allows BOTH drives to be physically set to Device 1. The "twisted" section reverses the drive select lines so one drive responds as Device 0, even though its jumpers are set for Device 1.

As a "last resort", "bottom of the barrel", "necessity is the mother of invention" solution, you COULD rewire the Atari drive cable to simulate this "twist" and allow a standard Device 1 3.5" drive to respond as Device 0.

Then ANY available 3.5" drive would work without modification.

You'd need a diagram of the IBM floppy cable to study- once you see how the reversing of the signals is done it's easier to understand.

There's also a very SLIM possibility that you might be able to obtain a floppy drive cable which was originally used to connect QIC-80 style tape drives which had the normal floppy drive female connectors, but which also had a male connector on it to allow the tape drive to be inserted into the cable. This could serve as an "adapter" which would eliminate the need to do ANY rewiring of the Atari cable.

The cable from the Atari would plug into the male tape drive connector and the new floppy drive would plug into the "A" drive connector. The floppy drive cable already has the "twist" needed, and you should be up and running.

The problem would be locating a dinosaur cable.

Yes, there were reasons why electronic equipment was so expensive before, sheer mechanical quality was superior to most of today's stuff. Some time ago I opened an old Tektronix workstation- NS32032 (or something like that) CPU- but the electronics was inside a thick metal shield, and all boards were mounted on some sort of hinges so that they could be opened like a book, and there were other nice tricks which I do not completely recall now. The mechanical beauty of that design was very impressive.

By the way, at work we still use some of those terminal servers. They have been running for about 10 years now day and night (they do not even have a power switch), and in all that time only one of them malfunctioned.

Cu.

I've had similar experiences with gear thats 15 to 20 years old, I recently salvaged an old sanyo pc, which in its time was a bog standard 286 machine, but the case for it was much more durable than anything I've seen in the 1990's and until I dissassembled it, it was still in operable condition. Actually it'll end up as a case for a host adapter and hard disks for one of my ST's. Same with those older ceramic ic's with gold plated pins, I hardly ever see anything like this recently, and when I do its tes expensive.

http://www.wizztronics.com:

Now you can add a low cost 3.5" IDE drive to your Falcon with a easy to install Adapter.

Why settle for a stock 2.5" 80MB drive when you can add an economical 3.5" drive for a fraction of the cost.

This adapter will allow the use of up to two IDE Hard Drives in your Atari Falcon Computer. You have the choice of One 2.5" and One 3.5" or TWO� 3.5 " drives.

Amiga dealers (You seem to be in .nl, and I think Computercity is still in business there) will usually be able to supply you with one.

I've recycled a whole lot of 10MHz DIP 68000s from an aluminium can
recycling machine made by the Finnish company TOMRA. Older models seem to
be 68008 or 6800 based, though. =)
OTOH, it's still quite possible to buy new 68000s in electronics shops.

Yes or you can just switch 10 and 12 over on the board by scratching the
trace.

I bought a Toshiba 3.5" PC drive for a friend's ST. I adjusted the jumpers and now it works perfectly. Of course it will only support 720k or less disks. I do not see a problem with the Sony after the jumpers are set correctly.

Yes- exactly..!

The "twisted" section of cable on a PC floppy drive cable is actually 6 wires wide- I'm not sure exactly why they reverse that many wires, but as you said, for the Atari it may just be a matter of reversing 10 and 12.

The reason IBM did this with the jumpers and twisted cables was that back when they first introduced the IBM Personal Computer, most systems were sold with only one floppy drive (and no hard drive) because they were so expensive.

Then when people discovered they couldn't do much with a single floppy system, they would have the second floppy drive added. As long as it was done by an "official" IBM tech person, there was no problem.

But when people started buying the floppy drives by themselves and trying to install them, the drives wouldn't work.

Rather than trying to explain to thousands of irate computer owners how to change jumpers on their new floppy drives, IBM came up with a way to allow ALL drives to be set the same, so no one ever had to change the Device select jumpers.

Because the normal situation was someone trying to add a "B" drive, they started shipping ALL floppy drives with the jumper set to "Device_1" , and developed the twisted cable that allowed the drives to also respond as Device_0 in the original installations.

Since the twisted cable became standard, the jumpers on the drives themselves were superfluous and as you've seen, have finally been removed from most designs available today.

In answer to your question about internal solder pad jumpers, there's no real way to tell if they're present or not without the data sheet (or taking the drive apart).

I don't know just how common they are, or indeed if there are drives that don't have any provision for changing the Device number at all.

I guess you could try opening the drive you finally end up getting, and keep the "cable twist" idea as a backup.

The IBM publicly-available POP designs and Bill of Materials for the latest version.

For this stage, I need someone (or a couple people) who are familiar with PCB layout/design.

For the next stage, I need someone (or a couple people) familiar with programming MiNT, FreeMiNT, SpareMiNT, etc.

And, does anyone know if/where a generic Atari ST emulator is in the PowerPC sector? Source code is a necessity and a person (or persons) who can code. The original programmer would be best.

"All it takes is just a few people to start agreeing..."

With today's SMD resistors and capacitors and other miniaturized components, having an actual ST 1040ST in vastly less space should be entirely possible. Couple this "mini ST" into the gut of a Neotari computer and... hmm.

Did you check the rubber belt that connects the motor spindle to the diskette spindle. Replacing that might solve your problems. I think it's the weak link in many drives. Everything else lasts for many years, but the rubber belts stretch or loose their rubberyness in a much shorter time.

Yeah, it is. One could stick all the Shifter, MMU and GLUE into a CPLD (Xilinx Coolrunner for portable version? :)) and it would be small. You could also use another chip to emulate all the other I/O chips. I think the YM would have to be a real chip for sounds but the rest is pretty simple stuff.

It's a nice idea but CPLD development kits don't come cheap, you'd also need an original CPU as well. In an STFM the DRAM bank muse take up near to quarter of the board area and this can be achieved in one small chip these days.

It's a nice idea....... uh. And it will remain on it. Only idea, what
nobody will ever build.

Btw. I have in my ST 4 MB RAM. I get it by breaking one 8MB SIMM module in
2 part and soldering about 10 wires for replace cutted lines. It is really
small. Other half is used too in other Atari.

here I am. I did not read the initial post. But if you want to bake a
new Atari, have a look at EmuTOS. This may be a basic OS for you:

I am proud to announce the launch of the Official Cleveland Free-Net Atari SIG Archive.

    http://www.atariarchives.org/cfn/

The Cleveland Free-Net, a free dialup and telnet BBS offered through Case Western Reserve University, was home to an active group of Atari users. The Atari SIG (special interest group) had information about every Atari platform, including 8-bit computers, 16/32-bit computers, Jaguar, Lynx, and Portfolio. The Cleveland Free-Net was shut down on September 30, 1999, but before it was, a complete backup of the Atari SIG was made.

Working with the folks who ran the forum, we have endeavored to preserve both the feel of the SIG and the information it contained. This is an amazing resource that exceeds 200 megabytes of data - much of which isn't available elsewhere.

"The Atari SIGOps hoped to preserve this extensive information resource we had built over the years. We approached www.atariarchives.org and Kevin Savetz with the idea of a permanent web archive of our SIG, and we couldn't be happier with the result." --Michael Current, mcurrent@carleton.edu, former 8-bit Atari SIGOp, Cleveland Free-Net Atari SIG.

Among the highlights:

A Time Capsule of Atari news items from 1986 - 1999
    http://www.atariarchives.org/cfn/12/03/

Atari 8-Bit Technical Reference Manual and upgrade guides
    http://www.atariarchives.org/cfn/12/02/

664 ST-related newsletters, including Z*NET and ST Report
    http://www.atariarchives.org/cfn/06/08/

A complete archive of Z*Magazine
    http://www.atariarchives.org/cfn/12/05/02/

Reviews of 79 Lynx games
    http://www.atariarchives.org/cfn/08/07/

Hi,

>What is a CPLD?

Complex Programmable Logic Device. Just like a GAL but adds a few more
functions and they can be very big with lots of I/Os on it. Nice, Lattice
and Xilinx are the biggies in the business AFAIK.

Hi Hallvard!

>I'm now wondering if the problem could be due to bad contact somewhere
>in the connection, or if it might lie with using the cable itself.
>Can an extension cable such as this pose a problem? Make the signal

>weaker, pick up noise from the outside-world etc?

OK, the cartrdige port on the Ataris doesn't like being extended. I recommend using buffers to clean up the signal and lessen the chances of ruining the computer. The cartridge ports data and address bus connects _direct_ to the CPU, not a good idea really. If you use some 244s (4 should do it) and buffer the data and address it should work a lot more stable. I would use something like HCT or F type TTLs.

c�t Romport Buffer & Expander

383. Eberhard Issendorf: (cp)
Her mit den kleinen Platinchen!
Expander f�r den ROM-Port des Atari ST
Projekt, Atari ROM-Port-Expander
c't 5/88, Seite 142

http://www.heise.de/ct/inhverz/search.shtml?T=Atari&thresh=1&hs=381

All in german language..
You can�t download an article online.

Best way is to use an expander device (buffer) for the rom port.
Use that a long time here with my ST and an bus cable lengh of 2 meters.
No problems anytime.

Regards, Robert

> Do you have this particular issue of C't?

Sorry, no. It�s too old. I doasn�t save old magazines.

> If you do, would you mind scanning it and making it available for me
> (and others who are interested)?

> I already have a cartridge expander (C-Lab Combiner), but the ROM port
> buffer sounds useful.

Yes. The buffer allowed long rom port wires. I use that in my fist st tower modification. They als have an expansion board called "expander"

That brings two rom ports selected by software. I use the expander card so that on port was internal, the second external. Internal port was lond time used by an eprom bank full with atari tools.

External port was used for midi romport network and some other

Nice handling.
Internal/External ports was switched by an simple GFA-Basic one liner.

I try to find somthing..

But it is german in all!

Watch Email.

Regards, Robert

I'm about to pick up an antique Atari 1040.
I don't know anything about these systems.
Main question: can it read floppies created on a PC (i.e. can I download
software via my PC and transfer them on floppy for the ST)?

>this into practical use.

Sure no problems.

>Do you have (or know of) circuit diagrams which would help me work this
>out?

Google groups isn't updated quickly enough but I there was a post by
Robert Schaffner on this "Extending the cartridge port" topic saying
something about ST Computer cartridge port buffer.

>And would such a buffer eliminate my problems of extending the cartridge
>port?

Yes, I see no reaosn why it wouldn't. If you're stuck I should be able to
draw something up. Should be quite simple.

>software via my PC and transfer them on floppy for the ST)?

Sure, just use double density disk, not high density as PC's use these
days.  You may get some you can format with your ST.  To format you can
use the ST or use the PC (I assume Windows) and select 720K to format.

Hi Hallvard,

The cartridge port is based on 2mm pitch, you won't be able to find
conenctors or edge cards easy. I made an adaptor to normal pitch with a
custom PCB.

At least he did *not* say a "junk Atari 1040 ST"...the
word "antique" lends an aire of distinction... I *love*
the ST!!! Back when the ST was the hacker's machine of
choice, there used to be a lot of binaries and sources
posted to Usenet for it... I am sure that this stuff is
archived somewhere on the 'net...

Lyndon, I agree BUT weren't some of the early 1040s supplied with single-sided DD drives? I know that STFMs were...

So Symon, if your machine should happen to be an early one with a single-sided drive (360KB), then this won't read PC disks unless they have been formatted as single-sided - I am not sure whether modern PCs can still do that. With these older machines (with TOS operating systems before 1.04) Atari-formatted disks are not readable on a PC, but it's OK the other way round. You can also get Atatri PD programs to write a PC-type root sector to an Atari-formatted floppy, though I am not sure if this works if your drive happens to be single sided. At worst, you can put most PC DD drives in it if you can get them - but they must be able to be switched to ID 0 rather than the normal PC 1; older drives had jumpers for that, more recent ones don't but sometimes have a solder bridge to allow change of ID.

Regards, /Peter/

     I have a Mega STe internal host adapter (Atari) that is
```

non-functional. Can anyone tell me the common failures of this board or suggest a diagnosis procedure. The most obvious symptom is that the hard drive does not spin up and is not recognized when connected to this card.
I have a second card and the hard drive works fine when connected to it.

Hard drive should be swiched (jumper) to SCSI ID0
Also PARITY must be switched of and most of that adaptors doasn�t like
an terminated SCSI bus.

-> DOITST

Regards, Robert

Hi Grazey!

As Steve Sweet suggested it could be a termination issue. The switch for termination at the back on my Zip is quite loose, and it could easily have slipped into termination off. That's what I'd check first.

>It did work on my Mega STe only a few weeks ago. I think you may be
>correct in that it's a cabling fault. My ZIP drive fell off my desk at
>about the same time, I think a couple of wires going from my Joystick port
>to the back of the ZIP drive may have been broken.

>Does anyone have the wiring diagram from the joystick port to the back of
>a SCSI ZIP drive (I've lost the original documentation).

I don't have the diagram but I could send you my cable as it is surplus to requirements, because I have another device in the chain. The cable is only necessary on STs with ACSI ports (I don't think SCSI Falcons have this problem) and the Zip is the one device on the chain.

Send me your address and I'll pop it into the post! :)

Cheers!

James

I should have it (at my parent's home in the cellar), since I built that
buffer PCB some years ago. Should still be somewhere around here ...

I can look up the article next time I get there.

Okay, that is the right one (the one with the SMD ICs is from the c't
article, the unbuffered adapter PCBs are extras by Michael Kugelmann - these
should not be used for direct connection to the computers ROM port).

The schematic is missing, but that should not be a big problem.

I am not sure if Heise still has PCBs, but with todays prototype PCB
production services (doublesided 160mm*100mm for 100DM), the PCB should not
cost that much provided you make a batch of as many as fit on 160*100.

Hi,

if anybody is familiar with Atari Cubase and using the Midi Mixer - I have a problem that has me fairly stumped: I want to create an object on the Midi Mixer to use as a 4-position slider (0-3 in value), which will set up the output of individual parts in a sound patch (dry, reverb, chorus, direct).

The thing is, to set up the sysex string requires a checksum for use with my Roland U20 synth. What do you use as a checksum for a sysex VARIEABLE value (ie xx)? If I leave the checksum out, nothing happens on the synth... if I put one in, the synth always says "checksum error!" (and I don't know what checksum to use anyway, since the variable value will make the sysex total change from settting to setting).

I'd appreciate some help if anyone can.

Thanks, Matthew.

Hi Bart

> I'm about to pick up an antique Atari 1040.

Less of the 'Antique' boy!!. 8-)

> I don't know anything about these systems.

You'l feel at home here!. }8-)

> Main question: can it read floppies created on a PC (i.e. can I download
> software via my PC and transfer them on floppy for the ST)?

Some people have problems reading disk from either platform on its opposite number, try formatting a disk on each machine, create and save a small text file on each disk on its host and swap disks to check readability. I personally can swap disk's formatted and written by either system.

I strongly recommend as a security measure against virus's that you throw the PC under the wheels of a large truck after transferring your files.

It is one and the same project. Later release contain an update of text and layout. (Contain part list you missed on first release also) :)

Both doing exactly the same.

Hi Hallvard!

>There are also a few other interesting projects in old issues of "C't";
>a 16MHz accelerator for one. This could be of interest if it works with
>an STe.

I'd like this also.  I know of diagrams (have about 5 different 16MHz
switchers) but all vary someway in how they switch the signal or by which
CPU signals.  I even have one that uses LS parts and I'd be worrying about
propogation delays unless they have been taken care of.  I trust the C't
articles and I'm very opened minded when designing stuff so I always look
at other peoples ways of doing things.  The C't archive seems uncomplete
especially on the hardware stuff.

RS>> Are there two different cartridge-port buffer projects?
RS>
RS>It is one and the same project.

There are two pojects:

-------------------------------cut--------------------------------

Her mit den kleinen Platinchen!
Expander f�r den ROM-Port des Atari ST
Eberhard Issendorf
Projekt, Atari ROM-Port-Expander
c't 5/88, S. 142 (cp)

Kleine Chips - gro�e Wirkung
SMD-Puffer f�r den ST-ROM-Port
Eberhard Meyer
Projekt, Atari
c't 9/87, S. 50
-------------------------------cut--------------------------------

The project in 9/87 is to buffer the signal from the ROM-port. So you can put a cable between the ST and the ROM-module. (romprtp2.zip)

With the projekt 5/88 you can connect two ROM-module the port. You can choice between the moudle with a pice of software or a button.

Hm - not sure.

Now that you mention it: I seem to remember that the original c't article
used some different ICs than Michael Kugelmanns version - I remember
74HC541 or something similar.

However, Michael Kugelmann's design should be functionally identical and
have the same pinout on the 2.54mm connector.

>A question relating to my original problem: with one (or both?) of the

Not sure. Some cartridge port accessories are a bit critical regarding timing, so cascading multiple devices is always an experiment.

Unless...

We regain the Atari brandname. Otherwise, we'd just be porting Atari apps to run under a different processor/OS platform. That doesn't make them Atari apps any more. It makes them X-app running on X-hardware. It's no different than porting any game from the arcade to the Playstation, or WordPerfect from DOS to the Atair ST. The reason those apps were considered Atari ST applications was because they were *unique* to the Atari ST! And, if they weren't, they were usually only ported to or from the Amiga platform.

If the effort to "revive Atari" is to have ANY hope, we must go to the source (Infogrames) and reaquire (by license) the Atari name with reference to a computer/hardware division.

However, we must be resolved to do this. We must see that anything less is utterly a waste of time and pointless. Emulation, for the sake of enjoying the "old ways" just one more time is simply a time-wasting "nostalgia trip". If we are so desirous to get back to the days of Atari's golden age, we must realize that it involves the NAME! An Atari computer is NOT an Atari computer unless it is called an *Atari* computer. And, none of the clones, regardless of their ability to run Atari ST/TT/Falcon030 applications are Atari computers.

And, worst of all, they will all die, if they haven't already.

We are in the last days of "Atari". The fumes the die-hards have been running on are evaporating into nothingness rapidly. Eventually, there will be nothing left and no one to care. And Atari, as a namesake, memory, and gaming pioneer... will be lost forever...

Say what you will, but you must answer me this. WHY do you use an Atari computer and the software that you run on it? Is it the applications? Is it the brandname? Is it the uniqueness of the hardware? Or is it just fond memories that keep you going?

If owning and using an Atari ST computer (or clone) is so important, then why isn't reviving the company that started it? It's not about the people who worked at Atari... they KILLED it, remember? It's not about the designers who made the cases (though I am still very partial to the 1040ST design myself), they've moved on. It's not about the features or limitations of the system. It's about the NAME! The company! The meaning!

An Atari computer isn't an Atari computer unless it's *called* an ATARI computer!

If you say that the name isn't important to you, then why do you use an Atari computer? If you say it's not the applications you care about, then why do you use an Atari computer? If you say it's not the nostalgic memories of having a computer that was ahead of the rest in it's day, then why do you use an Atari computer?

Nostalgia is a VERY poor sustitute for REALITY! Can you honestly say that, if "Atari" were to make a comeback, and started manufacturing computers, PDA's, laptops, and more again... that you wouldn't be thrilled?

If not, then you DO NOT know what it is to be an Atarian. Brand loyalty is an issue of pride and trust. Sure, that trust has been marred by the people who owned it before and the name "Atari" is merely being leeched for some game titles by Infogrames. "Atari" hardly means anything but "dead, ancient game company", these days, but when it was first created, it meant "Success!" (I believe that's the correct translation, if memory serves me right).

We can't bring back the past, but we can enjoy the present. I would love to go back to the days when The CareBear demos and STOS and Brattacas and Barbarian and BloodMoney and Shadow of The Beast and Xenon and 1st Word and DBMaster One and NeoChrome and all those other games and programs were around. If I had my druthers, I'd turn back time, stick myself right in the crux of the 1040ST years (there were at least three or four, weren't there?) and put it on an endless loop! I have NEVER been that happy. I've come close, but just when I think I can regain that same state of bliss, it vanishes. Why? Because BeOS is dead. Because Macs are too expensive...

Because nothing, but NOTHING... is the same as owning an Atari 1040ST back in 1986, right after my graduation at Pasadena High School. Do you even realize how excited I was when I saw the first 520ST ad in a magazine? Do you know what my reaction was when I saw my first 1040ST ad?

I remember it like it was yesterday... I owned an Apple IIc at the time.

The instant I was finished drooling over the ad and the features the 1040ST was boasting, I said one thing to myself...

"I'm getting it."

And as soon as I graduationed, I sold my Apple IIc and had my mother drive me to ComSoft in the Sun Valley, CA (I forget exactly where it was, but it wasn't too far from where my friend , James, lived at the time), and I bought one.

[Anyone remember "Logical Choice for Computing" in California?]

And if any one of you have even the tiniest HINT of a cranial concept of these same emotions, you'd realize that the name 'Atari" means almost more than the things they created. Shoot, they even made/sold CALCULATORS, for crying out loud! And, you know what? I'da bought one. I was so proud of my FAVORITE company. I wanted to work for them! I looked forward to going to the computer store to see what new software was released. I bought Joust and Star Raiders as soon as they were released. The list goes on and on...

I also went to every Atari Faire in Glendale, Ca. From the first to the last.

But those days are gone. The games were all so deeply copy-protected and tightly wired in Assembly Language, there's little to no hope of ever getting them ported to new hardware, with or without the Atari name. Psygnosis is dead (or at least I haven't heard anything about them from within Sony in recent years). Those games are dead. STOS is the same way.

The only thing we could do is find the programmers to port any and all possible ST applications to the new hardware. I believe, beyond a shadow of a doubt, that if Atari started making computers again... computers that had an OS that was simple and fun to use, but more powerful than TOS/GEM was, had some really nice hardware under the hood, and boasted of "Power Without the Price" again... we'd see the "old ones" coming out of the woodwork. And, I tell you this... I'd buy one in a heartbeat... even if it *wasn't* "leading edge".

Why?

Because it would be... an Atari!

Jared

All in all it is one project. Buffer and Expander.
Anyway the buffer can be used stand alone.

Hi all,

Seems that (at long last) ntl: (UK cable company) are to bring broadband cable modem internet access to my area :-)

Now, what will I need to connect my CT2'd Falcon to this service? Ideally I'd like to use MagiC and IConnect, but at a pinch STinG could be pressed into use. Magxnet and/or the added driver capability of MagiC 6.20 sound likely candidates. I really don't want to use MiNT.

Are there any "gotchyas" involved, such as incompatibility problems?

Cheers

The cable modems I know are either USB or ethernet. A serial port is much too slow.

cu

Derek,

In order to make sensible use of the service you need an Ethernet card, as the so called "Cable Modem" is not really modem at all. What you get is a RJ45 UTP connection, which you normally connect to your system via special "cross over" UTP cable.
I am not sure what the options are for Ethernet in the Falcon, as I don't think the cartridge port adaptors I have info on will work on such a beast.

```
If you don't wish to, or can't fit such a beast then you may have to use
something like SMOOTHWALL from www.smoothwall.co.uk. You will also I am
sorry to say also need an Intel beast to run it on, but as it is based on a
very cut down LINUX kernal it will run on a fairly minimal box. TR Computers
http://www.trcomputers.com/ often have these in the bargains section for
minimal amounts...

Dave Wade

> totally separate new port?

One port is as defaul allays on.
You -can- declare this port as "through" port.

This port is allways the default port after boot up.

The second port is avaiable by an button on expander board or with an
GFA-Basic on liner. If you switch to the second port the default port
goes off. (Do not do this while a rom card is on access) :)

> How would this work with my current setup which is as follows at the
> cartridge port:
>
> Atari ST -> Combiner -> Log-3 -> Unitor 2

Yes, i think so.

> Combiner: adds 3 extra cartridge sockets and one "through" socket for
> use with more than one dongle-based program. Switchable via SoftLink or
> manually with a switch on the unit.

Yes, but only one port is activ. I think that is the "through" port.
Any other port must be switched on or off by the user?
(I knew that part, but i doasn�t have one) :)

Regards, Robert

By the way: You can get my ready to use buffer/expander chain, i never use it longer..

I think I might need this approach anyway, because ntl use DHCP which I believe isn't compatible with any of the Atari drivers (?)

Hello,

There is someone who is using a cable modem with his Falcon. I know he
is using Sting to do it.

The last time the nurse let you out of her sight you had a master plan to acheive this, and were going to pop back here with the results, so since youve attempted it, not that long ago, what was the answer.

There is a DHCP-client for MiNT-Net, but I don't know how well it works.

I wrote (snail-mail, mind you) to Hasbro, with my "ad recording", and they
never replied.  No one else showed interest.  What was I supposed to do?  So
I gave up.

Blame the Tandy 1000HX and it's simple, double-sided motherboard and
cool/unique looking case for bringing me back.  It's amazing what old,
ancient stuff from the 80's can do to a guy in 2001.

Jared

Sounds interestting, looks like it gives propogation to the 8MHz for some
reason. I can't read German though so.....
Seems like a lot of stuff just for HD hack but if it adjusts the seek rate
I suppose it's OK. Actually, does this one adjust seek rate? Didn't look
like it did.

The cartridge port adaptor from Elmar Hilgart definitely _does_ work on a falcon, even on my CT2A machine.

Ok, it is a stupid risk, but I have been doing that, and the reverse, since 1985, and have lost absolutely no data that way. I have worn out disks, and found the reason why they failed, but drilled holes, or tape over those drilled holes, as needed, made no expletive difference.

Hi Hallvard!

>I'm talking about ready-to-use ones as well.
>What about the one from TUS or "hard & Soft (if they still exist)?

Photos show just an oscillator which I guess is 16MHz and one chip. This chip could be anything, can't see. AFAIK seek rate alteration is only needed to boot from a high density disk, am I correct? I know seek rate should be changed when on the desktop using DD and HD disks but most of the time it doesn't seem to matter, just makes more noise IIRC.

Hi Hallvard!

>I would like to get the exact specifications of the Atari cartridge port
>connector.
>First of all the spacing between the pins which go into the circuit
>board, secondly who produced this connector as I can't find it in any
>electronic components catalogue.
>
>Third I would like to know what kind of plug/socket is compatible with
>the pin-spacing of this connector as I'm planning to extend the existing
>cartridge connector.

2mm pitch, ie  2mm spacing between each conenctor.  The sockets I don't
know were to get.  I just unsoldered one of a dead ST.  The edge
connectors to go into them are just done on PCB CAD software.  I copied
the spacing between pads and stuff from my Forget-Me-Clock and transfered
it onto Scooter PCB software.  Then cut to shape and round it off slighty
to get rid of sharp corners.  Pinout is available in back of ST manual
which.  No maker is provided anywhere on my cartridge port socket.

Hope that helps.

Why did you do this?

I put a whole 8 MB SIMM under the STFM PSU, so far I'm addressing 4 MB, but
all the wires are there for 8MB, I just have to decode it properly.

The SIMM is in a socket, whhich is wired to the pins of the old DRAM chips.

You can't. The MMU can only address 4MB.

Same as here as Ekkehard says. Any day in perfect conditions..
(CAB download through DSL -> 35 k/sec)
(Maximum of the rom port used over STinG 1.26)

MiNT drivers made a better performance. Also CAB wastes a lot of time.

Regards, Robert

True but create more *banks* and it may be possible.  ST uses 2 16 bit
banks, if you stick an extra 2 in, you get 8MB total.  Shifter/DMA don't
get the memory but still good.

(Excuse for my bad English: I am italian)
Anyone can help me?
Many years ago I used an Atari 1040 ST to play music. My favourite program
was C-Lab Notator.
I don't like to use Cubase or any other programs.
How can I use now on a PC that wounderful program?
How can I reproduce my old arrangements maked with C-Lab Notator?
```

In few words, it's possible to reproduce that arrangements on my PC? Did you know if there is a C-Lab Notator version for PC?
Thanks.

Haal

Hi

The TOS in the STE is hosted on two 28 pin PROMs. I have the newest v2.06
TOS on two 32 pin EPROMS which fits straight into the TOS sockets.
But it does not work. The Operating System does not boot up, but bombs
repeatedly one second into the process.
What am I missing here?

Also, can I use a 1.4 MB diskdrive straight away or do I need the Atari AJAX
chip with 16MHz clock upgrade?

I once had the program XOR (Caged Artist), presumably in a cracked version
1.53. Do anybody in this NG have this program?

Any help would be appreciated.

Yup... crappy design flaws right from the start. The 68000 was capable of addressing a full 16Mb! That's the Tramiel Atari for ya. Didn't matter much back then... 1Mb was considered a ton of space! Now, if Atari had actually watched the advancements in technology trends that were going on around them and not just content to live in their own little bubble, I think we might have had an Atari that made computers that might very well be up to the 68060 today, if not the PowerPC processor of one kind or another.

It's amazing just how many companies have bitten the dust based on stupid, STUPID management errors. *sigh*

Jared

Hi Hallvard

Thx for your answers! I will try to look up info about this Jumper
configuration right away!
Is it possible to purchase the HD/DD switcher circuit anywhere?

About X-OR: You are right in that Tim Conrady has done great work in
converting various musicprogrammes into freeware. However all freeware
"Caged Artist - Bob Melvin" synth editors are "Standalone" editors. The
beauty of X-OR is that it can handle your complete synthsetup in much the
same way as Sounddiver, which you search after yourself. You can even,
fairly easy, create profiles for newer synths or midi gadgets that you may
have. I have used it myself.
Of course you shouldent condone the use of cracked software - but you, of
all,  know how it is. It is very difficult, if not impossible, to get the
official software. The original developers are long gone or have completely
declined to support thir old platform. This makes it very hard to obtain and
get support regarding official software. The platform is more or less given
up by the foundres who participated in making it the foremost music
platform.
I have been searching for Sounddiver for about 2 years before I gave up.

If we are honest, how many in this NG have not heard the name of "Mike
Hunter" distributed with "Another nice HOA crack" before?

Sincerely
Peter Feddersen

How do you want to "create more banks" if you can't address them?

You could add your own memory controller (like the MagnumST does), but it
won't be ST memory then, and doing so is a completely different thing than
just "adding some memory chips".

Disable the CAS from old RAM and put onto new simm when it is accesing 4-8MB range. Obviously you have to watch out for Shifter/DMA. I will be tsting to see if it's possible to fall the MMU/Glue that you are accessing 0-4MB space when 4-8MB space. Possibly generating a DTACK for that space (soon to be tried) or even generating your own A23-22 for the Glue from what the CPUs address is. As the ST does RAS refreshing then all abnks are refreshed together. Purely theorectical I know, but....

Is it possible to connect a SCSI 68 pins (wide?) hard disk to an Atari host
adapter? The disk is a Quantum Viking Atlas II.

Hi P�l!

>Is it possible to connect a SCSI 68 pins (wide?) hard disk to an Atari host
>adapter? The disk is a Quantum Viking Atlas II.

Yes, you can buy adaptors. Make sure it isn't differential. You won't be
taking adavantage of the fast speed the Quantum can offer (as it's wide)
but it's fast enough for an Atari :)

:>falcon, even on my CT2A machine.

: Yes indeed, but they haven't been available for some time now!

According to Hilgart's pages, there are still ROM port adaptors left, just
no parallel to ethernet adaptors to connect them to.

BTW, I've found an ESCOM parallel port ethernet adaptor in a shop. Does
anyone know whether that might work with the ROM port adaptor?

(Not being a hardware person, I hope this reply [mostly from what I can recall being in one of the Compendiums appendices] is of some use)

Did RAM exist in sizes larger than 4MB when the ST was designed? (ie assuming that the "talk to RAM" hardware was made aware of RAM above 4M, could one plug in larger capacity RAM chips into a 1985 ST?)

(I don't have my Compendium handy, so cannot give the actual values, but I seem to recall that the "ram type" in a bank was given a two bit value (range 00-11 ie 0-3), with up to two banks of ram.

The documented values allowed for up to four different values:
    128k bank (ie 16x64kbit) allowing either 128k or 256kbytes
    512k bank (ie 16x256kbit) allowing either 512k or 1Mbytes
    2048k bank (ie 16x1024kbit) allowing either 2M or 4Mbytes
although not documented, this could in theory have been extrapolated into
    8192k bank (ie 16x4096kbit) allowing either 8M or 16Mbytes

In original STs (pre 1990 STE, ie ST/STM/STF/STFM,/Mega), the top 384k was allocated to hardware (128k cartrige port, 192k TOS ROMs, a 32k "hole", then 32k hardware)

From the STE/TT/MSTE onwards, TOS dropped to address 14M, so RAM was limited to 0-14M address space [as opposed to a theoretical 15 5/8ths MB on earlier machines], TOS was allocated 1 MB from 14-15M, then a

640k "hole", and then the cartridge, another "hole", and then the hardware to complete the 0-16M address map.

(For machines with 32 bit addressing, Fast RAM follows this at address 16 M up to address 4064M, VME from 4064-4080M, then a mirror of 0-16 appears at 4080-4096M)

I think the MSTE gobbled a bit of ram space below the ROMs for its VME port

If your adapter use an Realtek RTL 8012 Chip, you have a chance to get
it work. Ask elmar.

Regards, Robert

hi all..

i have my old TT system here and i'd like to transfer the files from the 500mb SCSI disk to my windows 2000 system...

what is the most efficient way of doing this?

The 1040ST cartridge port was only capable of accessing 128K of ROM space, if I recall correctly. There were no other expansions other than peripherals like the printer port, MIDI ports, joystick, video out, and such. How or why memory addressing beyond 4Mb would be used for those, not sure.

They crippled the 1040ST and it's kin for years, all because of what? Spending a few dollars more for the *RIGHT* MMU? I tend to think full memory expansion never really entered the picture, in the Tramiel's mind. I think the old Bill Gates saying of "640K is all anyone will ever need" (or was it someone else?) kinda morphed into "4Mb is all anyone will *ever* need".

I think futuristic thinking (i.e. thinking ahead) was something the Trams were just too stupid to do or do correctly. Outside pressure was the only thing that made them budge, and when they did budge, it was in such tiny

```
increments and in the wrong directions, people just got fed up and left.

If I'da been at Atari's helm... ah, if only.

The most efficient way is transfering data using a drive or cartridge
that is both TOS and DOS/Windows compatible, so that both the TT and the
PC can directly read/write to it.
Note, however, that you need commercial software (HDDRIVER) to create
and use such a drive or cartridge.
A less efficient way (slow) is using a serial connection.

Of course it did, but that's not even interesting. The 68000 was after all
designed with a 16 MB address space back in 1979, fiv or six years before
the first Atari.
As for individual chips, they were far smaller than 4 MB, but that doesn't
really matter, either. There are expansion boards for such things.

Cool :)

>programming one of those as we've seen in many other circuits so far.
>So the search continues...

Yeah, seems like waste of a good GAL :) I think it supports 4 drives
(somehow) but who needs that many these days. 2 is enough.

> What am I missing here?

There are some wire links that need transposing, they are near the chips,
did you do that?.

> > Also, can I use a 1.4 MB diskdrive straight away or do I need the Atari
AJAX
> chip with 16MHz clock upgrade?

Its not that simple, you also need some logic to switch clock rates and step rates.

> I once had the program XOR (Caged Artist), presumably in a cracked version
> 1.53. Do anybody in this NG have this program?

Cracking isn't treated very lightly in here.

I have Timeworks Data manager professional, but trying to re-install it I find that my disk one and the two back-ups I had are all duff, could anyone out there up-load me a copy?

That won't work - the MMU does not generate RAS/CAS when addressing memory above 4MB, otherwise, expansion cards like the MagnumST could not work.

Actually, such an approach has been done: Martin Wevelsiep built such an extension, which gave up to 15.5MB full-DMA-capable ST-RAM. However, it required cutting quite some lines on the ST PCB, and the expansion card itself had more than 10 GALs on it.

>tsting to see if it's possible to fall the MMU/Glue that you are accessing
>0-4MB space when 4-8MB space. Possibly generating a DTACK for that space
>(soon to be tried) or even generating your own A23-22 for the Glue from
>what the CPUs address is. As the ST does RAS refreshing then all
>abnks are refreshed together. Purely theorectical I know, but....

If you generate your own DTACK, you are outside the area that the MMU handles: in that case, you have to build your own memory controller, and you end up with alternate RAM, quite like the MagnumST.

If you have some days time, I can package up my solution (which does
auto-steprate) and upload it.

Hi Hallvard!

>2 drives?
>One is more than enough for me, but for someone without a harddisk I
>guess 2 would be nice.
>Four drives is something I just don't understand why anyone should need.
>Probably causes more confusion than convenience (now, in which drive did
>I put that disk?).

Yeah, sure, 4 is over the top. I used to like my STE with internal floppy
and an external one for games. Monkey Island (wicked game) came on 4
disks so it helped.

I used an 8 Mb PC SIMM, with 4 CAS lines, which had resistors between some of
these lines. I removed the resistors to get 4 seperate CAS lines.
>
>That won't work - the MMU does not generate RAS/CAS when addressing memory

The existing refresh circuitry works fine, it completly refreshes the whole
memory, even the "uper" 4 Mb that is not being used.
>

It's been a while (3 years) since I last looked at this, but I did not cut very many PCB tracks.

So far, I have one small GAL which decodes the "upper" 4 Mb of the 8 Mb Simm & generates new CAS signals. It's sort of working, but I need to correct some timing issues. The memory is addressed, you do not get bus errors, but there are conflicts with the Shifter.

DTACK is generated by the GLUE, but this new memory is definitely ALT RAM, as the Shifter cannot access it.
>
>cu
>Michael

If I can get round to finishing it properly, I think it would allow 12 Mb in an STFM, assuming you have already got 4 Mb; or else 8 Mb if you just put in a single Simm & disable all of the old memory.

Hi Hallvard!

>What are the various options when it comes to accelerating an STe and
>expanding memory above 4 MBytes?
>Pre-assembled or DIY projects from circuit diagrams etc.

Hmm, Magnum which is nice upgrade, not sure if the STE version is still around. At the moment there are no DIY memory hacks or none I've heard of.

For speed you could stick an Adspeed or something like that instead of the CPU or crank up the bus speed a little. DIY hacks are simple 16MHz speeders which aren't that good (with cache=good!). If you speed up bus there will be problems with video syncs which have to be changed, especially if you use the standard Atari monitors as they're fixed frequency. I did get my STFM bus up to 16MHz, Shifter at 64MHz which made machine 2 times faster. I have to spend more time on it though.

Hello.
I use Platon for about 6 years. It can help you drawing PBC up to
6 layers, has a good library of chips (54xx series) and export
the schemes to industrial file format. You can of course print to
a standard printer. I forget some other things.
I bought it from APAK in Paris. I don't know if it is still
available. This soft runs only in ST monochrome high resolution.
Don't hesitate to mail me if you have some other questions.

Regards.

Hi Hallvard!

After complaining about Ben's 'commercials' I am a little loath to
post this :-)

Not free, but Scooter-PCB that I distributed in the English
version would do that very well. Price was �55, but I have no more
copies or manuals left. Try the author to see if he has any left
in German (or English). Email him on:
hkahlert@hk-datentechnik.de

>A program which could be used to draw schematics would also be nice

That Scooter won't do. But there are several German PD programs
that will, such as E-plan, Schaltplan and Transistor. Can't recall
if they have drivers for anything but pin printers, though. In
fact, I think you have to make a hard-copy off the screen for some
(Atari's only works for 9-pin printers, but Imagecopy is OK).

Unfortunately there is nothing on the Atari that will convert a
schematic to a layout - for that you need (rather expensive) PC
programs :-(

Regards, /Peter/

The version I own runs fine in 800x600 16 colors.

Hi Peter,

> Unfortunately there is nothing on the Atari that will convert a

And what about CircuIT and RouteIT?
AFAIR you can draw schematics and let them automatically convert to a layout.
It were under the distribution of Maxon, I think.

Ciao

I just acquired it. The floppy drive is the one that came with it. I've also tried replacing it with a drive out of an STf. And it still reboots.

I'll take a peek at the solder. But playing with the wires while the Mega is on and the drive removed does nothing. I would think that a bad connection would show up this way.

Well, I looked into the file that I dumped and it had lots of characters
and parts I recognise, eg BAD ROM, CRC etc etc.

>>If I run the same program on my STFM I manage to take read at the E00000
>>range and also write there with no bus errors or side effects. Surely a
>>bus error should be occuring as this STFM only has TOS 1.02! Sounds like

>
>Better check with peek/poke commands.

Will do.

This is for a battery backed SRAM in the area of $E00000 for TOS updates.
I noticed that even with the SRAM _not_ in place, I can "upload" to E00000
and download an exact copy of it from $E00000. Obviously it isn't being
placed there and is being placed in the RAM, as you say, probably by DMA.
This means I have to do poke/peek and writing to files sequentially I
guess.

I'll have to check what a poke does, it seems strange that the STE could
read from the ROMs perfectly, maybe this is a difference between models?

That also explains the DTACK thingy.

Thanks Michael.

It's not a bad connection, it's the power supply itself.

>>not be accessed at all: the DMA chip can only access RAM locations.
>>The operation will not fail, but you will not get what you expected.
>
>Well, I looked into the file that I dumped and it had lots of characters
>and parts I recognise, eg BAD ROM, CRC etc etc.

I'm quite sure the STE was able to read the ROM with a BSAVE.

>>Better check with peek/poke commands.
>
>Will do.

OK, done. If I peek/poke to $E00000 without my GAL generating DTACK then
I get bus error, with the GAL enabled I get no errors. With my SRAM in
place I can also put data there, do a reset and the contents are still
there. If anyone knows how to read/write files byte by byte please
contact me!

>I'll have to check what a poke does, it seems strange that the STE could
>read from the ROMs perfectly, maybe this is a difference between models?
>
>That also explains the DTACK thingy.

Maybe newer TOSes use Blitter for block copying when available ?
I don't remember all the details about blitter, but I think one could simply
copy block from source to dest. without any logic operations on the data...
Bliter behaves externally almost exactly like another 68000, so in principle
it should be able to do any type of mem. access 68000 can do....
You should check this also on some MEGA ST that has blitter...

Just a thought...

Regards,

Branko

They are known to be able to read audio data very precisely. Compared
with the cheap (ATAPI) drives by LITEON, for example, the mechanics are
definitely better.

Well, from the modulator (phone/RCA style conenctor) it is just RF, just plug directly into your TV and tune in. It's near the bottom of the TVs tuning range. If you go through a VCR first you may have problems as it may be on the same frequency as your ST. You can usually find a smaller adjuster on the back of VCRs, or easier, plug in straight to the TV.

>The above seems like more permanent solutions.

I just got them but they look quite complicated for what should be quite
easy hack. I only looked for a couple of seconds but it looks like you
need to patch TOS to look for the time at a certain address. My
Forget-me-Clock uses a Dallas DS1215 which uses an _external_ battery
(cell actually) and a small crystal (proabably 32.xxKHz).

This does require a program in auto folder and is also placed in cartridge
port but I see no reason why you could modify the program to "look"
somewhere else for it. I'll have to see how it works, I imagine it uses
the ROM signal(s) as it has no address decoder onboard. Did you want one
that didn't require auto folder progs?

TBH, I'd really like a rugby time module but they seem very expensive yet
the clock versions are only about �20. I know Conrad had/does have one

but I couldn't find it on their site. There is a special CPX that reads
the time by a spare serial port.

Correct - the blitter can access everything the 68000 can, which means it
can blit to/from alternate RAM, which the shifter can not access.

They are not the most silent drives - however, the firmware is quite good: they offer jitter-free audio extraction at quite high speeds (my PXT32 will do 12-20* with audio), and they are one of the few drives that do error correction when digitally extracting audio data.

Ah, so that's probably why my Plextor 12x drive doesn't skip when playing music thru CD-Reader on my Falcon. I tried a 12x and 32x Toshiba, but both drives kept skipping when playing CDs thru CD-Reader.

>>By the way, what makes Plextor drives more better than other brands?
>>Are the technical specs superior? Are they built better so they last
>>longer? More robust? yes to all of the above?

Do you know if a power supply from a 1040 STf will work in the Mega ST
series ???

I don't think you have to worry. The battery would last for ages.

The STf's power supply is smaller, and probably won't fit.It is relatively easy to repair the PSU tho. Firstly clean up all the joints on the PCB with some fresh solder.

> a plain composite video output where I should use my SCART connector?

It is an RF out yes, but its subject to the standards of the country it was intened to me sold in, so British ST's have a UHF output, whereas the one's for the US markets had VHF. Where was you machine destined for?.

> So far I've only tried the RF option, connecting it to the antenna input
> of my TV, but no go...

> But it would be nice to know if I need to go out and buy a SCART cable
> or just continue searching for the right channel.

A Scart would be the best option anyway, at least you'd have stereo sound.

--

Regards from STEve & his nice warm cosy PAK'd MegaSTE.

Hi David!

>UK model ST's usually output on CH36 which is right in the middle of the
>range.

Oh, all I know is that it apears on the tuning scale about a quarter of
the way from the left hand side. Near Channel 5 if you live in the UK.

> I'm a little confused again....
> You said the signal was RF, but I've been under the impression that
> SCART handles video and audio signals. Please elaborate.
>

It can be confusing as there are a rang of ST Models with different capabilities.

The STFM (ST with Floppy and Modulator) or STE (ST ENhanced) both have internal RF modulators. They have an RF Out that comes via a small "Phono" connector on the back.

These models can also provide Composite Video from the large 13-way DIN connector
on the back of the machine. On machines without a modulator this signal is missing from this connector.

All machines provide RGB via this 13-way connector. If you are going to use the machine much and
your TV can cope this is definitley the prefered method of connection. If not then use the composite if available.
Only use the RF as a last resort as the resulting display is disticntly "Marginal"

Note that not all SCART sockets are equal . Some TVs (I think early Trinitrons were an example) do not have RGB in on
their SCARTS. And TVs with multiple SCARTS may only have RGB on some and not all.

Hope this clears things up.

Dave.

Hallvard Tangeraas <northstar2010@______yahoo.no> writes:

: It describes how to make a real-time battery-backed clock using a GAL
: chip and some other components. One of them is simpler to make than the
: other. I have no idea how they work, but they seem to roughly resemble
: my already installed "Mega clock" which I bought assembled from an Atari
: dealer years ago.

: The "Areal 3.7" file describing how to use a Dallas clock module is
: probably OK, but I'm a little concerned about not being able to change
: the clock battery as it's inside the module.
: The above seems like more permanent solutions.

Some unsupportable comments. Areal37 searches for the clock module. In six-chip TOS, you can have six or seven clocks.

As far as I know, it would also find a Dallas clock chip at the cartridge port. I believe that is mentioned in the documentation. Eventually, I will find out if it can set a Zubair clock. It should, since it too uses the Dallas time socket.

If someone has a cartridge clock, will they please try it with areal37 and report?

The stated ten year life is shelf-life, before the battery is turned on, when the clock socket is first set. Beyond that, the battery charges from the power rail, discharges when not plugged in and turned on, and will wear out eventually, but if used often, it will be a long time before it is noticed.

It will work fine when turned on, but start to run slow when turned off.

Then, you replace the socket. This is no worse than the Falcon, where one replaces NVRAM to replace the clock battery.

I am quite pleased by the results of a DS1216 chip under a STe 32-pin TOS 2.06 chip and areal37.

Hi all!

I have a problem with my TT I wonder if anyone can help with. Well, the box has several problems, it's a real pain, and I'm regretting buying it now.

Sometimes when I hook it up to the power and turn it on, the power light comes on, the drives light up, but the monitor stays in stand-by mode.

I thought it was lose chips, so I pressed every single chip down (removed the PSU to get under there too) but it still did not work. It only works when I slammed the case down on the surface. So, what's wrong with it? I'm starting to think it looks like a PSU problem. This keeps recurring.

History: This is an American TT I had imported to the UK. It should not be a problem, as the TT will work on either power supplies, but I wonder if it is ...

Please help!

Pete.

The chroma encoding system is determined by the PAL standard, not the sound
system. Sound will be either AM or 5.5Mhz/6mhz FM

> > > But it would be nice to know if I need to go out and buy a SCART cable
> > > or just continue searching for the right channel.
> >

sound.
>
> I'm a little confused again....

The RF out i'm refering to is a phono socket aka RCA plug, the other video
interface is a 13 pin plug, this is video/chroma.sound out

> You said the signal was RF, but I've been under the impression that
> SCART handles video and audio signals. Please elaborate.

Scart is RGB or video/chroma and would connect to a lead plugged into the 13
pin socket.
Your STE should posses a 13 pin monitor socket for baseband signals and a
concentric plug for RF signals. This plug is physically attached to a unit
the size of a match box that's termed a modulator.

No problem what so ever with aftp. Username: ftp
                                   Password: a valid e-mail address

Anyway you can find this file on the Belgian ftp-server too.

ftp://chapelie.rma.ac.be/atari/docs/hypertext/chips_fr.zip

HTH,
Martin

>One thing I do remember however was that the HYP file is huge! Several
>Mbytes in size, so how it can be used on a standard ST is beyond me.
>Luckily I have MagiCMac on an Apple Mac, so it's not a problem for me.

It's 6.7 MB or so, but Idon't think that it's all loaded into memory at once. At least Alt-Ctrl-Esc shows only 64,256 bytes for ST-GUIDE with 9,446,424 bytes for SCREENMGER when HCP.HYP is loaded, which changes to 154,276 and 9,355,692 respectively with Chips 'n Chips X loaded. And if I park my drive with the title page open, for instance, and then leaf through the file with the arrows, after about the third page the drive starts up again with a corresponding delay before that page is loaded. I think that is fairly conclusive that only small paerts of a HYP are in memory at any one time!

Regards, /Peter/

>So far I've only tried the RF option, connecting it to the antenna input
>of my TV, but no go...

The RF output is on the phono socket and in the UK is set for UHF channel 36 or thereabouts. Probably different on machines made for other countries - the US ones probably have VHF out as UHF was not widely used there when the Atari appeared, IIRC. You ought to be able to plug it into your aerial (antenna) socket with a suitable cable and tune it in.

>But it would be nice to know if I need to go out and buy a SCART cable
>or just continue searching for the right channel.

You will get *much* better results with a SCART lead connected direct from the 13-pin DIN to an RGB monitor, or even a TV set, as this handles the raw RGB signals without having to modulate them bandwidth-limited onto a carrier, which not only loses quite a bit of definition but also shows nasty cross-colour and other patterning with fine image detail. It also gives stereo sound. Note that the SCART handles baseband video and audio, not RF - that's why it's sharper and clearer!

Hi, First time I write to this NGs.

I gues this was asked too many times already, but here it is...

How to attach PC mouse to an STE.

I've even found an old 3-button mouse with a large serial connector to
it, and ST software supposed to do the thing, but...

I plug the mouse into MODEM port, *.prg runs from a aUTO folder
and....

Left and right buttons do work, but it won't follow the moves.
Ocasionally a pointer will slide down and to the left, out of the
screen. Reminded me of a bad cable thing, but ohm meter showed cable
is o.K.

I don't have original ATARI mouse at all, but have the working body of
something called "Beatle mouse" (only cable and the jack are missing).
It has 8 pin connector inside, as oposed to original 9. If someone
could give me a hint where to look for a pinout scheme of this mouse,
that could be the easiest way.

Thank you.

Vladan L.

if its working when its nocked hard, its most definatly cracked soldering/dry joints

or maybe a chip socket isn't making good contact

It's likelly, unfortuneatelly. When I plug it into printer port (the
only one with apropriate connector), and install drivers, nothing
happens. It says no hardware found or something similar.

I hoped to atach this cable and jack to another, working, serial mouse
(instead of it's 9 pin), but connector inside don't match. ????

a serial mouse must be plugged into a serial port and mustn't be plugged into a printer port. any cheap Microsoft mouse or 2 button mouse with a 9 pin plug can be used on the Atari, you just need a 9 to 25 pin adaptor, which are very cheap. its no big deal.

O.K. Thank you. I'm already in a search for one (it's not so simple
task, at least here where I'm, as one could think).

Has anyone heard of some manufactuers connecting one of those special
data communication pins to 12v and other manufacteurs connecting it to
ground? Thats not good when you connect them together :)

TBH there's so many things it could be. It could be the PSU but if it
works for a long time when it's actually working then it's more unlikey.
Have you reseated the RAM? Have you tried pressing reset a few times?

I once bought an ST as it didn't work. It turned out that there was a
old staple underneath the motherboard shorting it out. I woud check over
the machine.

>History: This is an American TT I had imported to the UK. It should
>not be a problem, as the TT will work on either power supplies, but I
>wonder if it is ...

I believe it should not be a concern as it's auto switching IIRC.

IIRC, the connector is right, but is has a bit less power - so it might work if the MST is not stuffed to the brim with expansion cards, internal harddisk etc..

You will have to modify the mounting (or use the metal bracket from the MST power supply).

Hi Hallvard!

>Then there's the fetching of the data from Mike's GAL chip. Would it be
>possible for him to use his MegaSTe, get the data from it, and finally
>saving it as a file which he could send to me, or would he have to
>physically have someone with a GAL programmer read the data from the
>actual chip?

Well, the Mega STE can't dump the GALs content to a file. It needs to be put into a programmer to download the expressions. Problem is the GALs may have been locked which means it's impossible to get the data off them.

>...or perhaps the data from this GAL is even to be found somewhere on
>the net, or someone reading this has already got the data I need?

I tried looking but found nothing.

Hi everyone who replied,

The machine is now working again. I had checked for bad solder joints, odd

power supply voltages, and even loose chips. All are good things to have
on the checklist. After dissassembling and re-assembling the computer again
it now works fine. I even kept int running for a couple days straight and
its still good. Makes me think of an intermittent loose connection which
is something I'd normall find. I still think of it as a semi-mystery.

The Mega ST2 that I just acquired starts to reboot after a minute or two.
I've made sure that all of the chips are seated.

Could this be due to a flaky power supply ??? If not, does anyone have any ideas.

But what is McSTout ? A Nubus or PCI card with ST ports ?

And where can I find the programmer ? Are them free projects or can you buy them anyware ?

Hi Derryck, try and get a new fdd, teac make one that can be easily modified for a Falcon (ds0 etc), and take a copy of ahdi 6.6 for good measure. In case the boot sys file is gone. How long does the system take to get to its low res desktop? If it is taking a minute or two then it it won't be even attempting to boot off the hard drive.

Mark

I guess anything larger will be even more difficult to get, so see what you
can get. At least the 7174 were quite common some time ago.

The Magnum only supported one memory bank, and it has to cope with only 3
different memory sizes. Filling the memory holes is just one product term
which gets a bit more complicated, but not much - after all, it was only 1
hole IIRC.

Getting the DRAM state machine and refresh logic (even with cas-before-ras
refresh) working is a bit too much to fit into a single GAL.

Xref: archiver1.google.com comp.sys.atari.st.tech:2200

I've found a chapter in the chip'n'chips hypertext about the MegaSTE
hostadapter that seem to explain how to modify it to use two SCSI hard disks.
The problem is that I can't perfectly understand the german text, but the
only modification should be:

   Es m�ssen dazu lediglich zwei Dr�hte verlegt und ein 1 KOhm Wider-
   stand verl�tet werden!
   Der eine Draht f�hrt vom Chip U4 Pin 12 zu Chip U8 Pin 1, der andere
   Draht f�hrt von Chip U8 Pin 2 zu Pin 44 des SCSI Kabels der zweiten
   (also neuen) Festplatte.

Can anybody translate ? The rest of the text seem to explain how to set dip
switches and to manage with scsi parity or such, but check if you have the
original text, or I will post it complete... by email ?

Ciao, *Mike* mikenews@triesterivista.it www.triesterivista.it

Hi Johan,
I would be interested in using the bus error handling routine myself.
Might give me the urge to work on the 060 again. Haven't read from
Petr in sometime, he was suppose to compile an 040/060 friendly TOS to
burn into ROM.

Is there a control panel (prg/acc) loaded on the problem machine?
Usually if the AB gets to the desktop, there is an acc problem, video
configuration problem, NVDI configuration file problem or desktop.inf
file problem.
Usually booting with the shift key or control key (forget which
one)depressed during the second boot will allow one to get to the
desktop.

Mike

>would imagine the same as the Mega ST.

It is slightly more complicated on a Mega:

- Output on pin 12 of U12 (74LS11) has to be disabled (a trace cut on the PCB);
- Jumper W2 has to be reconnected in position 1-2 instead of 2-3;
- Jumper W3 has to be reconnected in position 1-2 instead of 2-3;
- Jumper W4 has to be connected, but there is no obvious place for it.
  A short piece of wire (about 20mm) has to be soldered. It should connect
  input to pin 2 of U12 to what was output of pin 12 (i.e. to the trace
  which was disconnected from pin 12 of U12).

All this takes care of proper decoding of "chip select" and "output enable"
of ROMs.

It is useful to find schematic of MegaST before actual hacking (it can be
found on the net). The above is quite clear from the schematics (in fact
it is noted in a table on the schematics).

Cu.

So what exactly is in this article? I thought the Junior Prommer was sold
as a commercial product and only your software to drive it went freeware.

Is this article the schematics then?

Well, does sound like a PSU problem. But then again, it could be a piece
of wire or something kicking around in it. There are a number of things
that cause syptoms like this. Do check PSU 5v though.

Didn't Michael Schwingen talka bout this only a few weeks back?  I wasn't
able to read news at that time but did find a couple of posts and it
looked like he designed it.  IIRC it did need an external TTL as well.

I found out that there is the IDT7174, IDT71B74,L7C174 and MK48H74 which
were pin compatible but still they're difficult to get.

>The Magnum only supported one memory bank, and it has to cope with only 3

>hole IIRC.
>
>Getting the DRAM state machine and refresh logic (even with cas-before-ras
>refresh) working is a bit too much to fit into a single GAL.

Yes I know but after you said that using FastRAM is actually faster then I
may reconsidder and try my hand at a DRAM controller.  I've been looking
at some design sheets for controllers on the 68030 and Z80.

I'm not really sure what to do TBH!  Cache seems easier but then having
more memory would be nice.  DRAM is rather fussy though but the TAG ram is
difficult to get.

I know this text. Here's the full translation:

From: Frank_Szymanski@do2.maus.ruhr.de (Frank Szymanski)
Subject: 2nd Harddisc in MSTE and Stacy

---------------------------------cut here-----------------------------

Modifying of the Atari hostadaptors in the MegaSTE and the STACY
(Copyright 01-05-1995 Michael Ruge - 65428 R�sselsheim)
(Translation 07-10-1995 Frank Szymanski - 45889 Gelsenkirchen)

The hostadaptor in the MegaSTE and STACY is only able to use one hard disk with unit number SCSI 0 without parity. With this little modification the host adaptor (fully Atari-compatible) is able to address two hard disks (compatible to the Megafile 44 host adaptor, which means that you can use the regular hard disk driver!).

* All you have to do is to add two wires and a 1 KOhm resistor!
* The one wire goes from chip U4 pin 12 to chip U8 pin 1, the other
* from chip U8 pin 2 to pin 44 of the second (the new one!) hard disk

* SCSI cable.

Both hard disks are connected to the same SCSI cable (therefore you have to squeeze a second 50 pin liner onto it) and the second hard disk has to be jumpered onto SCSI ID 0 (yes, you are right: both hard disks have ID 0!).

Cut the SCSI-cable between the first and the second hard disc, only and exclusively at pin 44 (directly behind the 50 pin wide socket of the first hard disc is recommended). Now the second wire from chip U8 pin 2 has to be soldered at this vein (to the vein which goes to hard disk no. 2)!

After you have done this, solder the 1 kiloohm resistor from pin 1 of the resistor array RP3 (pin 1 is the one which points to the inscription REV. 2 or REV. 3) to pin 2 of chip U8.

Now you need a Y-cable for the hard disks voltage and to put the computer into operation with the two hard disks. If necessary you must reconfigure your hard disk driver so it can find the new hard disk on system-bootup (Please refer to the driver's documentation).

Beware: The host adaptor has only been built for short SCSI cables! The cable should never (!!!) be any longer than 20 centimetres/7.8 Inch. For larger cable lengths there is another termination used than the host adaptor has (impossible to change!).

On the other hand you only need short cable lengths in the MegaSTE and the STACY (particularly in the STACY there is only room for one hard disk when you also want to use the disk drive) and even when you use a caddy 20 centimetres/7.8 Inch are more than enough!

Furthermore NONE of the hard disks is allowed to be terminated, so FUNDAMENTALLY remove the ending terminators otherwise the drivers on the host adaptor were overloaded and may disappear in a cloud of smoke (no joke!).

Finally: The device addresses:

dip 1	dip 2	dip 3	--------- dip-switches on the host adaptor
on	on	on	only ACSI-unit 0 (Atari default)
off	on	on	ACSI-unit 0 for the old hard disk ACSI-unit 1 for the new hard disk
off	off	on	ACSI-unit 1 for the old hard disk ACSI-unit 2 for the new hard disk
off	on	off	ACSI-unit 2 for the old hard disk ACSI-unit 3 for the new hard disk
off	off	off	ACSI-unit 3 for the old hard disk

ACSI-unit 4 for the new hard disk

LIABILITY

I, Michael Ruge, (me, Frank Szymanski, too) cannot accept liability
for direct or indirect damage in financial, material or any other way
which are caused by the use of these instructions.

These instructions were produced and tested with the highest care.

I cannot estimate how this list, instructions or modifying of your
computer corresponds to your abilities. The person who carries out the
above-mentioned modifications always bears responsibility. In case of
doubt let a friend or even your computer dealer do the modifications.
I cannot take responsibility for irregular done works (e.g. computer
is out of order) because I cannot verify if your abilities corresponds
to the demands to do the modifications in a correct way.

This is especially true when you work with voltage or currents
Electrotechnical laymen have to

STAY AWAY

from voltages higher than direct voltage 120 volts or alternating
voltage 50 volts (in Germany!). In other County's/Country's take a
look at the law of order for electrical units and regulations.

Electrotechnical laymen are all persons, who did not get equivalent
instructions or who do not have an electrotechnical education.

Hint: these instructions can be found seperately under `MEGAE_HA.TOS`
on bulletin board systems (german version only).

----------------------cut there-------------------------

I have seen some for sale in Germany - perhaps some of our German
colleagues can help. They weren't exactly cheap IIRC :-(

The latest Chip & Chips Rel X has an english version too:

Modifying of the Atari hostadaptors in the MegaSTE and the STACY
(Copyright 01-05-1995 Michael Ruge - 65428 R�sselsheim)

(Translation 07-10-1995 Frank Szymanski - 45889 Gelsenkirchen)

The hostadaptor in the MegaSTE and STACY is only able to use one harddisc with unit number SCSI 0 without parity. With this little modification the hostadaptor (fully Atari-compatible) is able to adress two harddiscs (compatible to the Megafile 44 hostadaptor, which means that you can use the regular harddiscdriver!).

All you have to do is to add two wires and a 1 KOhm resistor!
The one wire goes from chip U4 pin 12 to chip U8 pin 1, the other from chip U8 pin 2 to pin 44 of the seconds (the new one!) harddisc SCSI cable.

Both harddiscs are connected to the same SCSI cable (therefore you have to squeeze a second 50 pin liner onto it) and the second harddisc has to be jumpered onto SCSI ID 0 (yes, you are right: both harddiscs have ID 0!).
Cut the SCSI-cable between the first and the second harddisc, only and exclusive at pin 44 (directly behind the 50 pin wide socket of the first harddisc is recommended). Now the second wire from chip U8 pin 2 has to be soldered at this vein (to the vein which goes to harddisc no. 2)! After you have done this, solder the 1 kiloohm resistor from pin 1 of the resistorarray RP3 (pin 1 is the one which points to the inscription REV. 2 or REV. 3) to pin 2 of chip U8.

Now you need a Y-cable for the harddiscs voltage and to put the computer into operation with the two harddiscs. If necessary you must reconfigure your harddiscdriver so it can find the new harddisc on system-bootup (Please refer to the drivers documentation).

Beware: The hostadaptor has only been built for short SCSI cables! The cable should never (!!!) be any longer than 20 centimetres/7.8 Inch. For larger cablelengths there is another termination used than the hostadaptor has impossible to change!). On the other hand you only need short cablelengths in the MegaSTE and the STACY (particularly in the STACY there is only room for one harddisc when you also want to use the discdrive) and even when you use a caddy 20 centimetres/7.8 Inch are more than enough!
Furtheron NONE of the harddiscs is allowed to be terminated, so FUNDAMENTALLY remove the ending terminators otherwise the drivers on the hostadaptor were overloaded and may disappear in a cloud of smoke (no joke!).

HTH!

Regards, /Peter/

Hi Hallvard!

-------------------- start ----------------------------

Despite HD drive and floppy controller the computer doesn't work?

There is a total of 3 board layouts for the MegaSTE, and not all of them are HD-floppy-capable as supplied!

Here an extract from the "Installation of the HD Floppy Upgrade Kit" from ATARI:

EXTRACT start:
With a MEGA STE one still has to check whether a connection is present from U7 (68000 CPU) pin 32 to UA02 (PAL20L8) pin 19. If not, please solder a short wire to the underside of the board. In addition, IC UA02 has to have the marking C301901-002 printed on it. If you have built in an IC with the marking C301901-001, it has to be changed.
EXTRACT end

Notes by the author:
Those who are too lazy to remove the PCB can also fit a wire bridge from in 19 UA02 to pin 10 U8 (Cache Ram). This has exactly the same result, but has the advantage that the PCB does not have to be removed. But it is imperative that the PAL chip must be replaced if a C301901-001 PAL component is present!

It does not matter whether the computer has the DMA chip in a 40 pin DIL version or in a 44 pin PLCC-4 version, the measures described above have to be paid attention to!
The Pal belongs/ed to the items included in the original HD floppy upgrade kit (including TOS 2.06, AJAX chip and EPSON SMD340 floppy drive).

If the 1.44MB floppy does not format reliably, it could be due to the computer's power supply unit. The part number must end in

-002. If yours is a -001 PSU, the central PCB screw has to be removed. In addition the pillar into which the screw fitted has to be insulated from the PCB. All this sounds a bit peculiar, but it is really the case. During this you can also take the opportunity to check whether the "correct" opto-coupler SHARP PC111 is in place. If it is a CNY17, you may find that the screen flickers a little.

To use 2 floppy drives on the internal connector is quite simple. Simply connect the drive with a new IDC socket pressed onto the floppy cable and jumper correctly(!) to Driveselect B (setting) or alter the Driveselect jumpers.
If a PC floppy cable is used that has 4 leads turned through 180 degrees, then both floppy drives have to be jumpered to Driveselect 1 (i.e. B), as long as the drives will play ball.
If this gives rise to problems, the cable has to be modified by fitting a new unrotated socket!

If the blitter has to be removed for any reason (only if the Blitter (U205) is socketed in any case) the solder holes of resistors R224 and R225 have to be bridged with wire links or 0 Ohm resistors.

As regards memory, a MegaSTE can be expanded up to 4 Megabytes without major modifications. More memory than that is only available via FRAK and the PAK3 accelerator card, or the new MagnumSTE card for all MegaSTE computers available from the start of October 1997.

-------------------- end ----------------------------

Hey gang

When I load certain songs in Notator [maybe two different songs] and enter The Event Editor on certain tracks while the sequencer is playing, the speed of the song doubles. No visual changes take effect in the tempo, i.e. if the song is 100BPM it still will be 100BPM but playing probably at twice the speed. Maybe faster.

I then exit The Event Editor but the song continues at this warp speed but if I pull down any menu even without selecting anything, as long as the menu is open in the event editor or not, the song goes back to it's normal speed. Of course I cannot do anything till I close the menu so the problem is not solved. Nothing I do will remedy the situation until I quit and relaunch the application [Notator].

I have seen this problem happened over the years on some of my songs and noticed at one point that is seems to be probably related to a particular track that I would enter into that would trigger the problem but I have not recently double checked to make sure of this. This only happens on few songs not all of them.

My guess is probably that this track/song is now corrupted for whatever reason. But maybe somoeone else's guess or expertise might find the solution to this problem.

Thanks guys
Dave H.

I decided to make this one a new thread since this is problem number two.

I just recently finished building my studio and I am now back up and running Notator with the Atari Mega STe. FINALLY! Praise The Lord!

My Atari Mega STe has been sitting up for years unused and now that I have everything in place, I am once again reminded by my Atari of these problems that were never resolved

Every now and then my screen will appear with horizontal white lines from top to bottom. But to give a graphic description, think of opening up a blinds halfway and looking outside. This is how these white lines appear horizontally from top to bottom and all the graphics/text, whether it be in Notator or on the desktop is distorted. After a reboot the problem sometimes goes away but other times it seems to clear up on its own.

I have reformatted my had drive in the past to try an fix this problem and it went away for a while. I have changed the SCSI cable for my internal hard drive and it seems to remedy the problem but maybe not, since it came back. I have checked all my cables, connected, reconnected but with no solution. I might go out and get a new SCSI cable as a final resolution since the other two were older ones.

The only other thing I can think of is something wrong in the vertical circuits but I could be wrong. I am only guessing based on the way a TV Circuit works.

Thanks
Dave H.

Reseat all the chips inside, especially the simms.  You could check the
PSU is putting out a good 5v (little ripple).

> Out of curiousity... why would anyone install a second harddisk inside the Mega STe? Is there any room for an additional drive at all?

I don't think it's about installing another internal drive. It's taking advantage of the existing host adaptor to have two SCSI devices attached without having to go via the ACSI port, with the attendant additional costs.

> And with the cable-length limitations it won't be possible to connect an external SCSI device either I guess which means that you have to use a SCSI host-adapter...

Cable-length is a consideration, but it's easy enough to have a short cable if the HD bay is kept slightly open and a device is rested on top of the machine.

> On the subject of external SCSI host adapters: if I connect an external harddisk (or CD-ROM drive) to the Mega STe using an ICD Link II, should that device be terminated or not? The text about the Mega STe host-adapter modifications says explicitly that it should NOT be terminated, but how does this affect external devices connected through an SCSI host adapter connected to the ACSI port?

Connecting through a _different_ host adaptor is a seperate issue. I think you'd terminate it in the usual way.

Lines on the screen can be caused by memory problems.

The ST uses the top of memory to store the screen data before it is shifted to the video output, thus anything causing problems with that region of RAM can cause visible artifacts on the screen.

There are two possible causes I would check out-

The first is loose or oxidized connections where the socketed IC chips contact their sockets. This was the scourge of STs with internal keyboards, as the flexing of the motherboard caused by pounding on the keyboard would eventually cause the chips to creep up out of their sockets.

If your MegaSTe has been unused for several years, there may also be a problem of oxidation between the chip legs and the socket contacts. The heat generated by a computer in normal usage will help keep moisture from causing this kind of oxidation, but one which has been stored may have problems.

In any case, the fix is the same. Open up the system and gently, but firmly press all the socketed chips back down into their sockets. You should hear a "crunch" sound as the chips re-seat.

It can also be good to slightly pry the chips up a tiny bit before pressing them down, to "wipe" the corrosion more effectively. Be careful if you try this, just a slight movement is all you need.

The other cause of video problems like this can be bad RAM. If the bad area is only at the top of memory, it's possible for applications (which run in the lower regions of memory) to run properly while still seeing the effects of bad RAM on the screen.

It would be a good idea to run a memory test program overnight to see if any errors show up.

Also, removing the memory SIMMs and replacing them might help, as the contacts on the SIMMs can oxidize just like the normal ICs can.

You can use a pencil eraser to lightly buff the contacts on the SIMMs before re-inserting them to help remove any oxidation. (A white "ink eraser" is good to use, but if you don't have one use a regular "pink" pencil eraser).   Be sure to wipe off any residue with a paper towel before putting the SIMMs back in the system.

Turned out that the (original) Conner IDE drive had gone for a Burton!

Replaced the disk, she's now a happy bunny ;-)

Cheers.

Bob that is some pretty good detailed info. I saved it for later.
I did at one point push the ICs down as recommended from someone
on another list but I will be saving this page in case the problem
reappears.

Also thanks Lyndon. You guys are on the same wave legnth.

Dave H.

My Mega ST2 reboots after a few minutes. I think it's the power supply. But
there are two Power connectors on the motherboard.

Does it matter which one the power supply is plugged into ???

I've finally figure out what cases my Mega ST2 to reboot. But, not why. Maybe someone can shed some light on this for me.

------------> If I unplug the internal floppy drive, the ST does not reboot.

------------> As soon as I plug it back it, the ST starts rebooting over and over again.

I replaced the DD drive with an HD floppy. The ST knows that it's there. But still reboots. This I believe tells me that it's not the floppy drive.

Oh yea, I also used different desktop disks and also a blank disk. And I still get reboots.

Hi Hallvard,

>On the subject of external SCSI host adapters: if I connect an external
>harddisk (or CD-ROM drive) to the Mega STe using an ICD Link II, should
>that device be terminated or not? The text about the Mega STe
>host-adapter modifications says explicitly that it should NOT be
>terminated, but how does this affect external devices connected through
>an SCSI host adapter connected to the ACSI port?

The ACSI port is totally separate from the internal adaptor, so you must terminate drives connected to that in the normal fashion.

Check your power supply - this is the normal behaviour if the electrolytic caps dry out: the supply is enough for the ST alone, but once the disk motor is turned on, the voltags sags below the trip point of the voltage supervisor chip, which generates a reset.

Actually it's a common problem on the ST's. It's the power supply. The output voltage drops due to the power demnad from the floppy drive causing the re-boot. Cold solder joints on the power supply board were a common cause although failure of other P.S. components could give the same results.

Hi

I've just written a simple basic file in Metacomco Basic to write to or read from $E00000 (TOS 1.6-2.06) using the Bload/Bsave with &HE00000. I run it on the STE which has 2.06 and it seems to dump a rom image to the hard disk and an upload gives a bus error as expected.

If I run the same program on my STFM I manage to take read at the E00000 range and also write there with no bus errors or side effects. Surely a bus error should be occuring as this STFM only has TOS 1.02! Sounds like it is generating DTACK when it shouldn't be. The Glue is CO25915-38A.

I'm just wondering if I should generate my own DTACK or not when I install ROMs at E00000, two DTACKs being generated is asking for trouble, right?

Cheers.

Is there a chance that you could test it with a different TV/monitor. Are
these lines thick or thin.
Are there any other problems such as spotty pictures.
Does the machine actually crash or is it useable through the haze?.

I have a Link II in my STe setup. I use Extendos Gold and it runs a
Panasonic 24x CD drive just fine. Is the Plextor a CD-RW drive? If not,
then I think it would work just fine. Extendos works with some Plextor
CD_RW drives, but not have not been tested on all of them. Plextor
drives are very good. This taken from people whom I have talked to that
own them. I would offer somewhere between $50-$75 for a regular Plextor
CD drive.

I have a Plextor 12Plex CD-ROM drive and it works fine (at least connected to my Falcon with ExtenDOS Gold). I only paid US$15 for mine from the computer recycling center in my area.

A new Plextor PX40TSI is appr. $90, at least in Germany.

With an ST you will not be able to profit from more than 12x-16x speed,
indeed.

Are you sure you are really accessing the ROM?

If the target of the BSAVE is floppy disk or an ACSI device, the ROM will
not be accessed at all: the DMA chip can only access RAM locations.
The operation will not fail, but you will not get what you expected.

>If I run the same program on my STFM I manage to take read at the E00000

Better check with peek/poke commands.

>I'm just wondering if I should generate my own DTACK or not when I install
>ROMs at E00000, two DTACKs being generated is asking for trouble, right?

DTACK is open collector, so generating DTACK is correct and does not hurt
even if someone else does the same for your memory area.

Just make sure not to generate a faster DTACK for someone else.

Yup. My used PXT-32 was about 60DM, which should be less than 30$ by now.
The 12 and 12/20 models should be cheaper.

All Plextor CD-ROMs are very nice parts. If you need to be able to read
CD-RW disks, you need to get a 12/20 or faster - otherwise, the 12 should be
enough for normal use.

Even the slower drives work fine for all normal applications, and are more
quiet.

Even the faster models are acceptable with respect to noise I think.
Plextor drives are quite expensive but they are worth the money.

Yes. This looks like a variant of the real time clock used in MegaST.
A circuit like this would be about as atari-compatible as one can get,
without any additional software needed. Schematics for this clock circuit
can be divined from the circuit diagrams of MegaST which are available
on the net. The most complicated bit would be the address-decoding,
a PAL chip is used in MegaST but simple TTLs might be used.

I recently accquired an Atari 1040ST, and I have been enjoying it, but
I have come to a point where I realize that an extra floppy would be
very useful. I have read instructions on how to convert a PC drive to
Atari, but I have a working internal drive already - my problem is
that I want two drives. I was wondering if there is a way to connect a
standard (720 or 1.44) floppy to the Atari through the floppy drive
port, and have it act as either a second 720 drive or a high density

drive. Is this possible? If so, how can I do it? Any help would be
greatly appreciated.

Thanks!

Ian Primus

Thanks Uwe, perhaps I can contact Nima to see if the situation can be resolved.

I think I can say without doubt that they won't work out of the box, but
since there have been several LANCE based boards for the Atari, a driver
should be rather easily adapted.
Both the Riebl and the TUWTCP card are LANCE based.

Mind you, these seem to be made for industrial clients and as a
consequence might be quite expensive, perhaps more so than Mario Becroft's
graphics/ethernet card.

That was my point. I didn't think they could work directly but as there
is already some ethernet card for Atari based on the Lance controler it
should not be too hard to adpat those one (I don't say it's an easy task
but it's probably posible to do it)

> Mind you, these seem to be made for industrial clients and as a

I know but Mario don't know if he will have more time to spend on the
card (I had a short discution with him by email), so I was looking for an
alternative solution (not for me as I have a Falcon with the parallel

port adapter and I'll have an Eclipse probably next week) for people that
want to connect a MegaSTE or a TT in their existing network. I sent some
emails to some company doing VME Ethernet card and I'm waiting for some
answer. I already receive one from another company than the one I
mentioned in my first post and they are realy expensive, so I'm waiting
for more quote that I will post in this newsgroup if the price is interesting
(between $100 and $200 seems a good price as the ethernet car for
Atari computers are not produced anymore).

Regards, Rodolphe

Probably the easiest solution to this problem would be to check out
the "vintage computers" sections on eBay.

Someone is always selling Atari hardware, usually at very low prices.

Look for someone listing an "Atari SF314" external floppy drive.
That's the 720K version (Double Sided, Double Density).

To use a PC drive for an external floppy, you'd have to provide some
kind of case, a power supply and the interface board from the Atari
bus to the floppy drive.

Much simpler just to use the "real thing".

BobR

OK, I done the same to my Falcon and STE so look here:
http://www.lyndonamsdon.co.uk/tower/index.htm

Also John Hayward (I hope that is the right name) is doing the same to his Falcon.

Any feedback is much appreciated.

Agreed, but if you're (Ian) is good at electronics you could put an internal IDE drive in. There is a version by Pera Putnick and a slight modifiction of this design by J.Joogn(http://www.joogn.de) which doesn't need a programmed GAL and is a bit more simple (no buffers so short leads only!).

Hi All!

OK, my news server at my ISP needs a log in password so I haven't been able to get news for a month. Shock horror! Anyway, I'm using google groups at the moment, looks like I missed out on some good threads :(Doh.

Hopefully I'll be able to use my news server as I much prefer a decent newsreader.

So how will having an internal IDE interface help him connect an
external floppy drive to his ST..?

Hi Lyndon,

>OK, my news server at my ISP needs a log in password so I haven't been
>able to get news for a month. Shock horror!

One can always switch over to the IConnect stack which offers this feature, the ASH Emailer has a very decent newsreader and IMHO is one of the best available on our platform. Just check it out before dismissing it purely on the basis that the clients aren't STiK/STiNG compatible... ;-)

Cheers from Belgium
Dennis

OK true, but if he wants space then I think a hard disk is much better
and faster. I got the feeling that he wanted more space than just a
single drive and he may not have known about internal hard disks.

It just happened to me and I am in TOTAL PANIC!

1.while copying a few files from a floppy to the HD, a "can't create
directory" shows up
2. I ignore it, create the directory by hand, and copy the files
3. in the new directory a lot of mess appears after I copied the files
4. I browse my HD just to check everything fine

5. I reboot.
6. After the memory check i wait more then the usual time, then the 320x240 standard desktop appears; floppy a,b and trash.

I don't know if it's the HD or the Falcon.
note: I have two IDE Quantum HDs and a SCSI compaq HD.

Any help?
(any hope)?

Paolo

Hi, sory to bother you with my ab040 problems...

I made a lot of tests including changing the cpu (mine was a 68040RC25B old mask and I instaled a 68040RC33 latest mask). the toolkit still crash after the first reboot, it load everithing from the autofolder (nvdi 4.11 , selectics) and crash with 2 bombs when it arrived on the desktop. I tried to activate the debug option in the driver using the variable at the begining of the source and also by uncommenting the installation of the bus error handling routine but it doesn't seams to work... I tried at 33Mhz and 40Mhz abd it's exactly the same...
It works with the 4.09 toolkit and the original AB040 drivers.
Any more idea ?

here is my exact config :

TOS 4.04

STRAM : 4MB

Fast : 48MB (32+16) (I actualy have 1x32MB and 2x16Mb SIMMs so I can try all type of config.)

no more 68030 on the mother board .

530Mb 3"1/2 hard drive.

The power supply is a 250 Watt PC-AT one...

External TT keyboard.

Regards, Rodolphe

Looks as if the filesystem is corrupted. This is why backups are important. You may be able to repair the damage with tools like SED or DISKUS. But it is probably faster to use a backup for restoring the data.

IConnect allows the use of authentication for news servers - that's what I have to use for 08002go.

Hmm, my news server is fine now.  That means it didn't need a password
login.  That also means it was down for one and a half months.
Disgraceful!

OTOH, AFAIK the Riebl card is still available from some German dealers. Other
newsgroup residents might be able to confirm this.

En ligne avec Thor 2.6a.

It's amazing how many useful pieces of equipment are disguised as domestic
appliances: the machine for cleaning keyboard keycaps and shell cases does an
excellent job of washing clothes, while the tumbling machine for drying them
off also works for socks and shirts. The device in the kitchen for baking
small spray-painted articles can be used for pizza and muffins.  And so on...

Hi

I'm trying to upgrade an old 520 STFM to 4MB. First I tried four 1MB 30 STFM to 4MB. First I tried four 1MB 30 STFM to 4MB. First I tried four 1MB 30 pins simms and it was unstable, next I tried a 72 pin simm (4MB). That did nothing at all. Then I tried another 72 pin simm (again, 4MB) and that was unreliable. I tried the 30pin simms back in again and still the same. The 30 pin simms were wired like it is for an STE and the 72 pins were wired like the upgrade done to a Stacy at Jo Evens website.

I disabled the old onboard RAM by pulling the CAS lines high.

Basically the machine boots, and then black dots start to appear, filling the screen and it bombs out. I don't think the MMU/Shifteris dead as it used to have a Marpet board which worked fine but I foolishy sold it. Enabling the old onboard 512K RAM makes it work again.

It was soldered by using small wires and I took great care in the power supply for the DRAMs using thicker wire. It sounds like memeory curruption to me. The DRAMs I use are 70ns but then these work fine in an STE and Marpet.

I'm ashamed to admit that I need help on what should be a simple job. I've just spent 4 days solid on it, pretty much 2pm to 10pm.

Thanks.

Can you take a snapshot (with a camera) of the expansion and send it to me ?

Maybe I could help...

Otherwise, things that come to mind:

-always have solid wires for GND. Idea is to have a few, so that omic, as well as reactive impedance of the wire is small. 90% of the troubles come because the GND is not solidly routed to the RAM. Same goes for VCC, but this is less severe.
-all wires should be reasonably short. Most critical are controll signals RAS and CAS.
-while at it, this is a good idea to check PSU as well. If the picture twitches when floppy disk activates, this means that PSU is at it's last breaths.
If so, take a closer look at every big electrolitic cap on the board. If the top side is concave (and not flat), this means that someof the electrolyte has outgassed and the cap is dry. Exchange it for the cap with the same voltage rating and the similar capacity. This will make output voltage of the PS much more flat and voltage regulation will be much more precise. In other words, your 5V will be in tolerances at all times.

Hope this helps,

Regards,

Branko

A frend of mine upgraded another friend's computer to 4meg doing what you did (put 4 1meg simms) and it worked. I do not know just what exactly he did and how he did it.

>this is less severe.

Yes, I got a 4MB 72 pin simm again and soldered this in making sure I had all GND signals solder to the GND plane around the edge of the mobo. It doing the same thing as what happened when I first soldered in some 30 pin simms. Bank 0 works fine, no problem so I get 2MB. But when I hook up Bank 1 CASx signals nothing happens, I'll look on the scope to see if there is activity. I am using 68ohm resistors and I'm sure the conenction to the MMU from here is good as I checked with the DMM.

>-while at it, this is a good idea to check PSU as well. If the picture
>twitches when floppy disk activates, this means that PSU is at it's last
>breaths.

That helped changing PSUs from the old Atari one to a PC AT PSU. But the biggest help was extra GNDs. I use the PC PSU as it's a lot safer when testing on the bench.

Anyone on ideas why Bank 1 doesn't work? The RAS/CAS connections from MMU to the DRAM chip are fine and so should be the data/addr if Bank 0 works fine. It doesn't suggest bad power supply here as it just doesn't work at al, even reseting the machine gives nothing.

Thanks Branko

Biggest help ? That means that before you have added extra GNDs it was
noticeably worse ?
If so, that means that some of the timings or slopes is on the edge of what
RAMs will tolerate.
If I were you, I would:

-clean all pins on MMU and its socket. I use special eraser with glass dust
inside, but a few touches with extra fine glass paper or nail file should
work also. While at it, check the corner pins on the MMU chip. Sometimes
they can touch under the chip when chip is in the socket.

- deactivate bank0 (RAS0 to VCC on RAM's side and unconnected at MMU) then
place bank 1 on its place (connect bank1 RAS to MMU's RAS0 and CAS's on
corresponding bank0 CAS signals) and see if it works then. If not, try
pinpointing right half of the bus by activating both banks on the same RAS0

from MMU but tryuing both CAS signals on each half of the bus. That way you'll know on which byte lane of bank1 lies the fault.

- short the inductance that filters the voltage supply for RAM's. This can be worth checking especially if you didn't removed old RAMs. This coils is at the elko on the left side of the board (on the ST 520)

-check if all other signals made it to bank1. If you are using the 72 pin SIMM then check only data pins and RAS/CAS signals as everything else is shared- if bank0 gets it, bank1 should, too.

- you had to solder an extra adress line from MMU chip-A9. Did you forgot to place 33 Ohm resistor in series at the MMU's end of the wire ?

- try shorting those 68 Ohm resistors on the CAS lines and then also on the RAS.
If nothing goes better, remove all shorts.

- remove old RAMs from machine. I always do this first, before I do anything else, but I understand why someone might not like that idea.

Generally, every expansion I have wired together worked at nominal freq. (and far higher) like a breeze without fiddling with existing resistors, after initial debugging ofcourse (like shorted adress lines, switched CAS and RAS signals etc), but those are easy to catch.

Regards,

Branko

I was planning to design an interface to allow me to use a standard PC
keyboard and mouse on my STe, but I'm having trouble traking down the
relavent data I need on the Atari keyboard.

Does anybody have any, or know where I cna get any data on the atari
keyboard. In particular I'm looking for timing diagrams and protocol for
the serial link between the keyboard and processor.

If all you want to do is to use an external keyboard on the STE
I have Atari Mega ST keyboards complete with adaptors for sale.

Barrie at Keychange.

From experience.

I have done a... few soldered-in FM upgrades
but always to 2.5mb only.

4mb was unstable, 2.5mb meant you always had bank 0 to boot from.

If you don't need 4mb stick with a reliable 2.5mb.

I have a few Extrarams in stock, all populated.

??
If you don't remove old RAMs, you can always reactivate old banks by swapping a few wires. And you can activate almost any bank combination you like. You can even force new ram to behave like old one by fixing highest address line on the ram stable (high or low, it doesn't matter, but before that you have to disconnect wire from MMU ofcourse).

There is no rational reason why one should have more fallback options with
2.5 Mb than with 4Mb.

Once again, IT SHOULD WORK 100%. If it doesn't, that means that something is
seriously wrong and one shouldn't count on the remaining working bank. It is
somewhat like driving a car without one weel. Depending on the
circumstances, it might be driveable, but certainly not safe...

Regards,

Branko

Thanks, but I'd really rather design and build an interface myself.

I also wanted to attach a PC mouse through the same interface.
I have enough data to be able to interface and read data from the mouse and
keyboard with a PIC, but I dont know what form I should send this to the
Atari in.

>you'll know on which byte lane of bank1 lies the fault.

I made an interesting discovery just now. I connected both banks up and
pulled MAD9 high to the positive rail. This worked fine, proving that both
banks work with no problems, but obviously only giving 1MB of RAM.
Remember a single bank of 2MB also worked fine, how odd?! Sounds like not
enough power or something but I have two thickish wires supplying the Vcc.

I also tried putting both the DRAM banks in parallel to the MMUs bank 0.
Not to try and see if it gives 4MB (obviously not, only 2MB!) but to see
if power was a problem as this will keep both DRAM banks active and
simulate full load as would be the situation for 4MB.

>- short the inductance that filters the voltage supply for RAM's. This can
>be worth checking especially if you didn't removed old RAMs. This coils is
>at the elko on the left side of the board (on the ST 520)

Yep, tried that as well. Not too sure why there is a inductor there as it
was left out on the STE AFAIK. Perhaps to stop AC or keep the voltage
high on the elko side?

>- you had to solder an extra adress line from MMU chip-A9. Did you forgot to
>place 33 Ohm resistor in series at the MMU's end of the wire ?

Indeed.

>- try shorting those 68 Ohm resistors on the CAS lines and then also on the

>If nothing goes better, remove all shorts.

I may try this, as I only did it for the bank that I first thought was defective but the above discovery goes against the theory that one bank was not working.

>- remove old RAMs from machine. I always do this first, before I do anything
>else, but I understand why someone might not like that idea.

After the machine is working with 4MB I will as it's neater and less stray signals. I leave them there while testing so I know the machine is still working OK when I re-enable them.

Thanks again.

I recently acquired a 4mb Mega STE off E-Bay. However the machine has a
German TOS. Does anybody have a spare English or US TOS 2.06 or 2.05 ?

Or is there anywhere such a TOS may be bought ?

Cheers

Grazey

I forgot to mention, but repeat those steps on GLUE chip also. Don't swap
GLUE and MMU by accident ! If you end up with both chips on the table and
have forgot which is which, then it is usefull to remember that MMU is
always near DRAMs (for obvious reasons), that GLUE
has marking CO25915 and MMU 25912. Isn't that remarkable ? I don't have
photographic memory and I did not took a peek inside ST's guts for some
months, but I know GLUE/MMU markings by heart. It shows that I learned this
lesson by mistake ;o)

BTW: Which SIMMs are you using- 32 or 72 pin ? If you use small 32-pin ones,
you should know that parity bit should have its own CAS, but on many SIMMs
its shorted with main CAS. With 72-pin ones this issue is moot as they don't
have separate CAS for parity.

Anyway, this is just a thought that might come handy sometimes later, since
the simptoms do not point in that direction.

> Yep, tried that as well. Not too sure why there is a inductor there as it was left out on the STE AFAIK. Perhaps to stop AC or keep the voltage high on the elko side?

Well, ST's design is pretty poor and signals are not clean as a whistle. Main problem with cheap double sided big motherboards is that power distribution shares same planes with signal lines and main problem is GND. GND is always problematic, because it distributes power to the chips and because it has a signal role- it serves as a reference point for all signals. TTL logic has 0 from 0-0.8V and logic 1 at 2.4-5V RELATED TO THE GND LEVEL !
If you have big energy consumers on the PCB you will have big ohmic losses in the power lines. If those consumers are very transient in nature, inductance of the power lines will fight against sudden current changes and so the voltage at the chips will fluctuate. You can fight that (which you must) by simply adding small, fast cap as close to the chip as practically possible that will cover fast current fluctuations of the load and give power lines a chance to deliver much more constant current.

But those caps don't help you against GND potential ripple and difference. Any diference in GND level between two distant chips will affect their logic levels, since they measure voltages, relative to their GND potential. It is crucial for the GND to have as low impedance and resistance as posible across the motherboard. If your Vcc has a ripple of 0.2V, this would be well in the tolerance specs, but if those 0.2V show as a potential diference in the GND level across the board, some chips would "see" logic 0 at 0.7V and others at 0.9V, which is quite %% difference...

DRAMs are known for their ugly transient nature (while average current might be mA's, peak currents can and do exceed 1-2A !), so the ST designers gave the RAM field extra elko cap and used inductance to disable sudden changes of the RAM current. They have probably feared that this current would cause voltage fluctuations that would show as the raster in the picture. Since newer DRAMs churn much less per chip and tjere are much less chips, one can short inductance without any obvious ill effects.

>
> >- you had to solder an extra adress line from MMU chip-A9. Did you forgot to
> >place 33 Ohm resistor in series at the MMU's end of the wire ?
>
> Indeed.

Simptoms show that there is something wrong with A9 line. Does the thing work after inserting the resistor ? If not, try buffering the A9 signal with something like 74HCT32 or similar, just to take the load of the MMU's. Weak signal on the pin might mean ill MMU, since it should have more than enough oomph to drive two banks, but you might try it.
One more thing. All wires must be as short as possible, and it is usually clumsy to route A9 from the bottom of the MMU's socket to the RAM's that are on the top. I usually drill 1.5mm hole through the board near the MMU to get the wire short. BE carefull to drill through the GND area and to miss any

signal tracks.

You might wonder why those resistors are for. DRAMs require that all signal edges be not too steep nor too gentle, typically 1-10 ns in order for signals to be recognised. MMU is CMOS chip and those are known for steep edges. So, designers have used small resistors in order to limit the maximal currents and so to limit the slopes.
There is more to that, but lets leave it for now.
BTW: You can see those same resistors on almost any 386 or 486 board (value might vary), so this is not uncommon.

Regards,

Branko

WD 1772-02-02 is capable of using HDD floppy! But you must have correct PAL
chip and TOS 2.06 !!

Yes, in most cases (on earlier versions of motherboard) you must get new PAL
and conect some points on motherboard.

OK, tried buffering A9 and still nothing. The only thing I can imagine is a dodgy MMU that has problems working with 4MB. Sounds odd but what else would cause this odd behaviour? Usually you can get something on the screen, even when CASh and CASl are wrong way around a scrambled picture does come up. It's only when I try 4MB that I get nothing, just black screen. Floppy light stops that dim blinking as well, machine just dead.

Does anyone have an MMU (STFM type, PLCC) that I could borrow to test if it is my MMU causing problems?

Thanks.

Hi!

>1) He believed the machine had an HD disk drive option installed, but I
>beg to differ. Upon opening it up I see that the disk controller is a
>1772-02-02 and not an "AJAX". The disk drive is an Epson SMD-380.
>I believe this is a standard 720K drive, correct?

OK, 02-02 can take high frequency but it's better to have it _only_ at
16Mhz when it's accessing an HD disk. The Epson SMD-380 is the drive that
comes in most STs, only DD. The Falcon I had used a Epson SMD-300 which
was HD drive.

>According to "Chips 'n chips" (a German HYP file describing all Atari
>ST/TT/Falcon etc. hardware out there), changing over to a HD disk drive
>is more than the matter of changing the disk drive and disk controller.
>Although my German is a but rusty, I believe the HYP file explains that
>a pre-programmed PAL chip must be changed and a couple of connections
>underneath the main circuit board have to be joined.
>Can anyone verify this?

I've heard about this patched GAL before for the high density to work.

>2) According to "Chips 'n chips", this machine has the "old" board as
>it's probably one of the early models.
>Are there any significant differences between the "new" and "old"
>boards? Any problems I should be aware of?

Don't know about this, never seen a Mega STE.

>3) Other than that it seems that the TOS has been reprogrammed (it's
>Swedish, but the keyboard layout seems all wrong -it looks more like a
>UK or US setup), and using "Profile" it indicated that a US version 2.00
>TOS is installed!!!!
>I never knew there was a version 2.00, but perhaps this shows up because
>it's been custom programmed.

If you're using Magic when you did the test it will show the first number
followed by zeros, eg 2.06 becomes 2.00, 4.04 becomes 4.00 and so on.
If the ROM was reprogrammed I see no reason why the reported TOS version
should have to be 2.06.

>If I buy the machine I'll want someone to re-program the TOS chips
>getting back the original Swedish TOS 2.06 (I'm in Norway, and all
>machines here were delivered with Swedish TOS as our languages are
>almost alike, and the keyboard setup is the same, which means that the
><ALT> combination to get at some characters also works, unlike those
>keyboard remapper programs which only work for <normal>, <shift> and
><capslock> combinations).

I hoping to put Magic into ROM for my STFM as hopefully I'll be gaining
access to Eprom burners, PIC programming and such. I'm thinking of having
it switchable so I can use 1.02, 2.06 and Magic 6.01. I do own all these
ROMs/software which were properly licensed.

>Cosmetically the machine looks OK except for the plastic behind the
>cooling fan which has been removed (the owner complained about it making
>too much noise as there was too little space for air to pass through, so
>that's why he did it.

Seems OK as long as the price isn't over the top.

Well it took yet another new IP but I'm back for a while. How nice it is to see news from this September. Now where's that tosser Dave??.

Check the earth lines to the RAM that you're fitting ...DRAM can be a horror for problems there....had a 4Mb conversion in an STF once that would start and then bomb out like that, and adding extra earth paths to the board solved the problem. It was the reason that I always recommend not to try and fit an internal IDE conversion as well as a 4Mb RAM board to an STFM (as well as the pysical nightmare of squeezing it all in there wiht a hard-drive....maybe we could persuade Mario to add 4Mb to the STFM IDE boards he does....a 4Mb plus IDE conversion would be a winner with me...I love my STFM with IDE in it in my studio, but I wish it had more than 1Mb...

Bryan, do you still have the system? I see another guy is looking for just the mouse. My old ST seems to have lost it's internal floppy drive. If you still have the system, I'll be happy to pay shipping to western Massachusetts plus I'll offer you $50 if it works properly.

If anyone else out there has a functioning 1040ST, I'll make the same offer in case Bryan no longer has his. I need it for my work as I wrote some software for it that I never converted to my PC.

German book 'Atari ST Profibuch' has detailed information about pocket
formats etc.
As I remember no timing data.

>in my studio, but I wish it had more than 1Mb...

OK, if you see the recent threads I've fixed the ground problem but now I have another problem with the MMU accepting 4MB of DRAM.

I think I'll be putting in a DIY IDE interface, I'm going for an ultimate hacked machine. So far I have it at 50Mhz and will be getting CPU to 25Mhz. Lots to do, lots of work, like trying to sort out video sync. I know steping from 32Mhz pixel clock to 50Mhz doesn't work as it doesn't on my Falcon, seems like even mulitples work better so maybe 48Mhz or possibly 64Mhz (yeah right!). This is why I changed to 70ns RAM and now I need to reprogrammed into faster ROMs and possibly change data buffers (244s abnd 373s IIRC) from LS to HCT.
I need to buy faster CPU, sort out some cache, faster serial port, HD hack
 Lacescan etc etc etc :)

Hi Hallvard!

>> WD 1772-02-02 is capable of using HDD floppy! But you must have correct PAL
>> chip and TOS 2.06 !!
>
>I knew this would come up ;-)

What goes around comes around :)

>The discussion about the 1772-02-02 being able to or not being able to
>handle 16 MHz (HD mode) is one that shows up here from time to time.
>Some people say the 1772 (with a 02-02 sufix) will have no problems with
>this, others disagree.
>The *fact* however is that the 'AJAX' is *designed* for handling up
>to 32 MHz (ED mode) while the 1772 is not designed for that.

OK, I'mt hinking it's more of a problem on a bad 16Mhz signal which comes
out of STE shifter. I only have a scope that does 2us/div so I can only
see 500Khz signal at it's best! Didn't you have an Ajax or am I imagining
things?

>As for the PAL chip -is someone here able to program one of these for
>me? Of course an original has to be used to read the data from, so
>someone with a PAL programmer and a MegaSTe with the suitable HD capable
>PAL chip.

I'm gonna get my GAL prommer made, the one I ordered over a year ago. I

put it on the shelf after buying a Falcon but I want to use it now. I'm
not sure if it can read boolean expressions but I'm sure the modified
listing _must_ be floating around the web somewhere, maybe on some maus
net archive?

>I'll see if I can decipher more of that German in the HYP file.
>Anything else I should keep in mind with this machine?
>(I already know about the rather basic SCSI adapter which doesn't have
>parity and only supports SCSI ID0).

Hmm, a small heatsink on the CPU as it does get stinking hot.
A blue LED, sure looks great on a rack unit, you could put a lot on in a
long row for various hardware, eg, serial port activity, midi
activity, HD/DD mode, hard disk (one led for each ID!) etc. Friends will
be impressed when you show them as it looks like the stuff they have in
movies :)

Check the part number on the MMU-

I have a vague recollection that Atari used some purposely crippled
MMUs in some of the machines which wouldn't address a full 4 Megs.

They used to do things like that to try to keep end users from
expanding the memory themselves.

Maybe someone else has the actual part numbers for you to check
against.

To connect the Megafile 30 to a 1040ST or 520ST you need a special cable.
Got one for sale? email goldsmith@mindspring.com

thanks

I thought about that too, but:

- he said that one bank was working perfectly with 2Mb. Therefore A9 signal
had to be O.K.
- crippled MMU, if exists, surely has to be extremely rare beast. I have
never came across one,
through a couple hundred machines that I did RAM expansion on.

Still trying to get at least one each of a "mostly all there" Mega Ste, TT, or Falcon, so that I can test out upgrades and possibly start developing my own. Already have oscilloscope, universal device programmer, cross assemblers, etc. Also of course looking for additional development tools, software, upgrades, etc. Willing to offer my services for Pal, Gal, Eprom, and other towards fellow atarians.

>
> Does anybody have any, or know where I cna get any data on the atari
> keyboard. In particular I'm looking for timing diagrams and
> protocol for the serial link between the keyboard and processor.
>

actually on the atari there is :
- a keyboard (physical device)
- an 'intelligent keyboard' IKBD made of a 6301
- an ACIA 6850
- the actual 68000 processor

the IKBD communicates with the ACIA via a serial line, with 8bit data, 1 stop bit, no parity, 7812.5 baud (500 H4 divided by 64).

The protocol used is the 'IKBD' protocol, well documented (findable
on the internet)

To know how the IKBD controller communicates with the actual
keyboard (physical device), you will have to download the 6301 ROM
to the Atari (using opcode 0x21 - read memory- of the IKBD protocol),
then disassemble the 6301 ROM (4 kB). When doing this you will find
what parallel lines of the 6301 are wired to the keyboard matrix, to
the mouse and to the joystick.

Information on 6301 disassembly can be found on the internet (the
6301 is a 6800 clone, look for '6800 simulator'). the Motorola
MC68HC11 manual can also be of help.

Laurent.

You should check that
 - the SIMM you are using has the right type of DRAM on it, ie. symmetrical

ones with an identical number of rows/columns
- the SIMM really has two separate banks, and that there are no connections
  between the bank0 and bank1 signals on the SIMM

>had to be O.K.

Sure is fine with one bank. This is what is so odd, it works OK with one
bank of 2MB and then also OK with two banks of 512K, so why doesn't it
work with two 2MB banks!!
I've buffered A9 and still the same, not even a white screen, just blank!

>- crippled MMU, if exists, surely has to be extremely rare beast. I have
>never came across one,
>through a couple hundred machines that I did RAM expansion on.

Beats me, trying another MMU is my last resort.
I may try using the 512k onboard ram for bank0 (which it usually is) and
then hook up half my 4MB simm for bank1. 2.5meg is buggy but it may prove
something.

Thats interestting Bob, thanks. It's a CO25912-38, I didn't see anything
"special" listed about this chip in Chips'n'Chips so I wouldn't be sure,
it's the first time I've heard about that. I wonder why they bothered
putting in the MAD9 seeing as there was only enough physical space for
1MB, I guess future expansion.

The Mega STEs are pretty good. Yes I was getting all confused :)

Excellent! Thanks Laurent.

Could you just clarify the following if you know;

The keyboard sends data in 9-bit packets at 7812.5 baud, i.e. a byte of data and a stop bit - is that right?

Is the data sent MSB or LSB first?

Is the same format used for sending data from the Atari to the keyboard.

Cheers,

~~~~

Hmm. CO251912-38 MMU is as vanilla as can be. It should work.
One thing that comes to mind is that there is something wrong in the triangle CPU-GLUE-MMU and that CPU can't see properly more than 1 or 2 MB RAM. How can that be ?
Well, maybe there is some bad contact on the address line from CPU on MMU or GLUE or the CPU is bad (partially burned pindriver). Which adress pin ? I would suspect A20 or something close to it. It could be shorted to some neighbouring adress pin (A19 or A21) or just too slow transitioning from low to high.
Check for shorts with "beeper". Clean the contacts on GLUE. Possibly replace CPU. You have wanted to use faster model anyway IIRC. This would be the right time to replace it. While at it, use good socket. Far fetched, I know, but quite possible...

Regards,

Branko

>- the SIMM you are using has the right type of DRAM on it, ie. symmetrical
>ones with an identical number of rows/columns

It has two 416C2000 (Samsung) which I believe as 16bit, each having a RAS
and two CAS. I checked with DMM for continuity between both DRAMs on all
the CAS and RAS lines and to see if the simm was wired OK for the job.

>- the SIMM really has two separate banks, and that there are no
>connections
>between the bank0 and bank1 signals on the SIMM

Apart from sharing the MAD and data signals they are seperate. They use

RAS 0 with CAS 0 and 1 for Bank 0, and RAS 2 and CAS 2 and 3 for Bank 1.

The machine works with two banks but only if MAD9 is pulled high/low.
Exact same thing happened with 4*1MB 30 pin simms.

Hi Don,
I've been saying much the same for quite some time. Thats the reason I have 2 real 8bits, a TT030, and 5 ST's of various flavours. the pc hardware I have runs linux, which it handles better than trying to pretend its an atari of any flavour.

Hi Rodolphe !

Did you tried at normal speed rate instead of 33 or 44 MHz ?
I know that i had a lot of problems with bus acceleration, and finally
i remove the added 40 MHz oscillator...

But if your machine work with TK4.09...This is the one i use...

Hi everyone,

Recently my Falcon disk drive packed up (after I attempted to insert a disk in it that was not in the best of health). Even after cleaning the heads the old disk drive will read but not write. As the old drive was a bit wobbly at the best of times I decided to splash out on a new PC HD disk drive thinking that it would work. Er no, two different types of drive later and no joy. The Falcon doesn't detect the drives there at all.

My machines a CLab Mk 1, with fourteen megs.

Any Ideas?

Thanks in advance!

regards,

Thomas Wellicome

IDE or SCSI? In general you can use any of these drives with the Falcon.
Maybe you were just using an outdated hard disk driver like AHDI.

I suggest that you contact Robert Schaffner (rsmac@t-online.de). He is a
specialist as far as hardware like the AB040 and CT2 is concerned.

You're a genius, or am I an idiot, well both of those actually :)
I did a cheap'n'nasty 16Mhz hack on it ages ago using one of those 157 data select thingys, it was unrealiable so I later removed it.

I took the power for the 157 off the CPU at pin 49 (Vcc). Right next to it is A22 and A23, and just a quick look shows solder had got behind these pins and shorted them together. I session with the desolder braid and solder sucker and the machine now reports 4MB! At last!

Sorry, that was a silly mistake to do. Thanks anyhow, time to buy/find a new CPU I think. I don't know how to re-pay you!

It's almost 1:00 AM and I'm convinced I must be mad to be working at this
hour at ridiculously low hour rate, even for our standards. This comment
gives me sort of mental fire escape. I'm not mad, I'm just genius. Oh well
;o))))

You just did. Have a beer in my name. Or better yet, don't. I'll have one
myself. I have just remembered about new shipment sitting nice and cool in
the cellar :o)

It should work if you change a couple of jumpers on the drive. Sometimes
they are hardwired and you have to move/remove a couple of resistors
instead. I don't remember the configuration, but I have done this once.

Regards

/Peter

Hi,

Thanks for the help :-). Not having any kind of electronics background (I could only just get my head round the lightbulb and switch circuit at high school) I feel I shouldn't be let loose anywhere near jumpers!

regards,

Thomas

Hi,

Um buy a SCSI card for your PC if the drive uses that connection. Other than that your a bit limited. You could try networking the machines together I suppose!

>It's almost 1:00 AM and I'm convinced I must be mad to be working at this

>hour at ridiculously low hour rate, even for our standards. This comment
>gives me sort of mental fire escape. I'm not mad, I'm just genius. Oh well
>;o))))

One thing I don't like doing is soldering late at night, just doesn't
work. It was probably late when I was trying to install that 16Mhz
upgrade which has caused hours of pain. I worked 3 days solid trying to
get the damn memory working, going through various simms. Oh well, it
should be stable with all those ground connections :)
I don't have fume extration either, which I'm sure isn't good for my
health.

>> I took the power for the 157 off the CPU at pin 49 (Vcc). Right next to
>> it
>> is A22 and A23, and just a quick look shows solder had got behind these
>> pins and shorted them together. I session with the desolder braid and
>> solder sucker and the machine now reports 4MB! At last!
>>
>> Sorry, that was a silly mistake to do. Thanks anyhow, time to buy/find a
>> new CPU I think. I don't know how to re-pay you!

I see. I already wondered why you would clean the heads of your hard
disk driver :-). But believe it or not: I know users that have tried to
do just that.

>The Falcon doesn't detect the drives there at all.

There's usually two problems: The floppy ID needs to be changed (to 1 or 0, can't recall which), and often, the data cable needs to be plugged in twisted through 360 deg. You might need to cut the small nib on the data connecter to allow this. Look in the Atari FAQ for more help.

Hm - and a single bank works fine with 2MB? That sounds really strange.

I would give you a MMU, but it might be a bit too far away for you to pick it up :-)

Hi

Sadly, after many years I have finally got to the point of clearing out my old Atari ST/Falcon stuff. I was originally just going to give it away because I dont think it has any real value now, but the thought of how much I've paid for it all makes it soooo difficult. Everything in original boxes c/w manuals, all perfect condition. Someone make me an offer... :)

Hi there!

I wonder if anyone can help me with a Linux question. I'm planning on ordering Debian Linux and installing it on my Atari TT. My question is, is it possible to run X-Windows on a TT? I don't have any graphics card, just the bog-standard TT. :) I have 18 meg of RAM.

Thanks for the help!!

Peter.

Hi Peter,
I haven't tried it yet but I suspect xwindows would work. I know the mint
xwindows software will work on less powerful systems than what you've got.

Yes, this is possible, but it is so slow that it is not much fun. If you seriously plan to use Linux you should not install it on the TT but on a faster machine.

Even if it works, 18MB is really not enough to run X11 and more than a
single XTerm on a machine.

I just installed Debian on a Motorola blackhawk board (133MHz PPC604), and
only had 16MB during installation - it works (I did not dare to start X),
but is a bit slow already. Even if you gain a bit of memory using a
custom-built kernel, that will not be enough to get real work done in X.

cu
Michael

I doubt the CPU is the problem here, but it's hard to be sure.

>after the first reboot, it load everithing from the autofolder (nvdi 4.11
>, selectics) and crash with 2 bombs when it arrived on the desktop. I

Yes, you mentioned this in email earlier.

>tried to activate the debug option in the driver using the variable at the
>begining of the source and also by uncommenting the installation of the
>bus error handling routine but it doesn't seams to work... I tried at

Well, no one here is likely to know the first thing about that debug flag
and the bus error handling routine, since those things where added by
myself and Sven Karlsson for the AB040 version of the AB040 Toolkit.
Most people have not even seen the sources.

>It works with the 4.09 toolkit and the original AB040 drivers.
>Any more idea ?

I'll build a debug version myself (to make sure that functionality is
100% operational) and send it over.

The bus error handling routine, when properly activated and set up,
should make it impossible to get bombs. Instead, you should get
a message telling you where things went wrong.

>Fast : 48MB (32+16) (I actualy have 1x32MB and 2x16Mb SIMMs so I can try all
>type of config.)

I have only 16 Mbyte myself, and the amount of memory could indeed cause
a problem like this. It shouldn't, of course, but bugs come in all shapes
and sizes...

Should not be a problem.

Thanks for everyones help! I intend the TT for use as only a CLI box
anyhow, but was interested to see if X would operate. As for using a
faster machine, I do have some very powerful PC boxes, but I want
to install Linux on my TT as more of a personal interest project!

Be prepared to fiddle a little bit with the X86Config settings. Now that Roman has less time to work on Debian, the installation is not so much adapted to TTs anymore. The default colour depth was 8 when I installed X11, this is not exactly what you need for the built-in mono display (TT high). You have to set it to default colour depth 2. X starts up afterwards (at least it did on my TT), but you still have to change the default colours for background etc. I haven't done it until now (lack of time), it is presumably set to whatever colour and the effect is, that you see nothing but a black screen.

Best wishes,

Kerstin

You could try a modem-to-modem connection if you have modems in each computer. Also a direct cable connection (RS232) using a terminal program... I used Flash to transfer files from a Kaypro (ancient CPM operating system) to my ST. Worked pretty fast.

Otherwise you could zip the files and transfer with floppies... that's what I'm doing now with my KCS songs, to use with the Steem STE emulator.

Cheers,

Cort

I would think it would run fine. Another option is to install Mint,
Xaes and  the Gem X-server. Then you will be able to run X Window
programs right on the TT desktop.

Is there a way I could possibly get info, manual, etc on a Midiplexer? I bought one and do not know how to use it. No manuals. What is it for anyway?

I wanted something like export to use with my Atari Notator but will still be 100% interested in what this box does.

I use a Mega Ste with Hard Drive as well.

What is it for? And can I still use it with my setup and modify it if necessary?

Thanks
Dave H.

Hi Lyndon

> OK, my news server at my ISP needs a log in password so I haven't been
> able to get news for a month.

Are you sure your attempting a PPP login and not chap?.

> Shock horror! Anyway, I'm using google groups at the moment, looks like I missed out on some >good threads :(Doh.

Ive been away for this peiod as well, Tiscalli decided to take over LineOne and 'improve' it in line with its other IP's, this meant that Atari newsgroups died. So once again i was forced to change IP's.

> Hopefully I'll be able to use my news server as I much prefer a decent newsreader.

I think you'll find that Madasafish is in the world group and has now been swallowed by Tiscalli who are sure to 'improve' things!! :-\

Time for you to find another IP!.

So far this list is Atari news unfriendly AFAIAC.

Hmm, they're working OK at the moment.  I can't FTP and the �10 a month
thingy is not available due to "technical" difficulties.  These ISP's
suck, I wish Zetnet was cheaper.

I am involved in a discussion concerning the so-called MMU chip in a ST, so I was wondering if someone might help me with some items and thus save me a lot of searching on the net and borrowing a multichannel 'scope.
Here they are:

* MMU accesses RAM data at 250ns pace, alternating 250ns for CPU/DMA/Blit and 250ns for Shifter and refresh, so that, e.g. each CPU read or a Shifter read cycle takes 500ns (4 beats of the CPU clock). Is this correct?

* Is the above 500ns (2MHz) RAM-access pace synchronized to the system's 2MHz signal so that, for example, CPU access is -always- on "1" half on the 2MHz cycle and Shifter access always on the "0" half -or vice versa (or phase-shifted)? If it is not synchronized, is there a signal available which reliably shows whether RAM is currently being accesed by Shifter or by the CPU etc?

* It appears that CPU can try to reach RAM at a time when data is being transferred to the Shifter- so occasionally a couple of wait states would have to be inserted by the CPU. Is this correct?

* Refresh is performed during the Display-Enable-off time, in the 250ns periods otherwise dedicated to the Shifter. Is this correct?

* What method is used for RAM refresh? Is it CAS-before-RAS (using internal address counters in the DRAMs) or RAS-only (using an address counter in the MMU chip)?

Thanx in advance;
Djordje

I'm still waiting for my new scope, so I can't be 100% sure about this, but
I'm pretty confident..

> * MMU accesses RAM data at 250ns pace, alternating 250ns for CPU/DMA/Blit

For CPU yes. Shifter only latches actual data on the bus, which only need
happen this 250 ns window, but can repeat with the rate up to 500 ns...

>
> * Is the above 500ns (2MHz) RAM-access pace synchronized to the system's
2MHz
> signal so that, for example, CPU access is -always- on "1" half on the

Since all frequencies are derived from 32 MHz through counter in GLUE, 2MHz
CLK should be synchronised with memory cycle windows...

>
> * It appears that CPU can try to reach RAM at a time when data is being
> transferred to the Shifter- so occasionally a couple of wait states

Yes.

>
> * Refresh is performed during the Display-Enable-off time, in the 250ns
> periods otherwise dedicated to the Shifter. Is this correct?
>

Think so, not sure if it is not done by interlieve. On some machines RAM
gets refreshed by shifter reads. Just use rows as columns and vice versa and
every shifter read will access next row insted of column, which does
refreshing BTW.
No need for separate refresh as long as shifter is working...

> * What method is used for RAM refresh? Is it CAS-before-RAS (using
internal
> address counters in the DRAMs) or RAS-only (using an address counter in
> the MMU chip)?
>

I'm almost certain it's RAS-only or normal read cycle. In those days not all
DRAMs knew about CAS-before-RAS, especially those 256kx1...

Not to forget 64k*1, which the MMU also supports.

Yes, I really tested this - when I got 4 64k SIMMs for free some time ago, I
had to plug them into a MSTE, and guess what: it worked :-)

YOu should have an address strobe if a "normal" master accesses the RAM, while the shifter should not generate one. You may additionally need to take the bus arbitration signals.

>* It appears that CPU can try to reach RAM at a time when data is being
>transferred to the Shifter- so occasionally a couple of wait states

Yes - however, only a few opcodes are affected by this.

>* Refresh is performed during the Display-Enable-off time, in the 250ns
>periods otherwise dedicated to the Shifter. Is this correct?

I am not sure if there *is* a dedicated refresh in the ST - I *think* the shifter does this (with row & column addresses reversed, as was already suggested). Since the ST does not use any page mode, this does not matter speedwise.

(Yes, I know that is it not "the shifter" who does these accesses - it is mmu and glue together. Basically, you can't really seperate the ST chips - it is more or less one big chipset which is broken up into several physical pieces of silicon).

You should write to the head honcho and complain. All the ISPs I've ever used
have included the comp.sys.atari groups.

Of course you are!!, but I had to dump them as their Atari groups didn't propagate properly, I think you'll find that there's huge holes in there. I used to find messages on some servers that didn't get to these listed IP's, messages that were important to me at the time.

I've just ticked them all in Outlook and did a rescan and the servers that
still work only have news back to July for the Atari bases I use.

I was really poxed off with AbelGratis not updating Atari news as I'd got
some real cool email address that are now useless. I had .sweetie-lovers,
.clubatari & .sheeplovers. I cannot get to the pop server via anyone else's
dial up and I'm not making another call just to sync them!!.

If it is not synchronized, is there a signal available which reliably shows whether RAM is currently being accesed by Shifter or by the CPU etc?
>
>Since all frequencies are derived from 32 MHz through counter in GLUE, 2MHz CLK should be synchronised with memory cycle windows...

2MHz signal is in Glue, but probably by dividing the 4MHz clock which appears to be created in MMU, and I was worried that maybe MMU has a separate frequency divider for creating these memory-access windows, which might perhaps some time be in phase with Glue's 2MHz and sometime in opposite phase, depending on how the counters start on power-up. Or is it all guided from Glue anyway by those -RAM, -DMA and -DEV signals or something like that?

"Michael Schwingen" wrote:

>You should have an address strobe if a "normal" master accesses the RAM,
>while the shifter should not generate one.

I am afraid this wouldn't do, because CPU may try to reach RAM at any time, aven during Shifter access, and so although CPU asserts -AS, I suppose it would have to wait a bit until Shifer memory cycle window closes.

As you may have guessed, the subject of discussion was the simplest way to properly handle Alternate RAM, and with what Branko said about access windows and RAS-only refresh, now it seems much clearer to me- it appears that it would be OK to decode CAS0 and CAS1 to old or additional RAM banks, depending on the state of CPU's highest address bits and the phase of 2MHz clock (there is more to it, of course, but the rest seems to be relatively easy).

Sorry for the long silence but I was in France and getting back tu USA was a hard Task.
I already tried to slowdown my Falcon to 33Mhz and it didn't change anything. As I'm back I'm going to make more test this evening and let you know the results.

Regards, Rodolphe

Hi Steve,

I too use freeserve (mostly, but obviously not at this moment) and I don't think the problem is "Atari", its just "news". Usenet is creaking in many places and as many "customers" don't use it its often last on an ISP's list of what to support. I used to use a much more expensive ISP and whilst their phone support line was "free" (actually national call rate so they should have been getting some kick back from it) , on most occasions I had problems it was no more use than the free serve 50p/minute one. And their e-mail support did not even bother to to reply or acknowledge receipt. of messages, so again not much use.

Dave.

Hi, I'm back.... Meaning that after being away from Ataris for 8-9 years, I've just picked up a few 130xe's and ST's.

What I'm looking for are Pictures or Diagrams of motherboard layouts for a 1040 STf and a Mega ST2 .

I need to know what's stock and what's not. Like the 1040 STf was suppose to be stock, but it has Rainbow TOS 1.4 and looks like it has 4 meg of ram.

The Mega ST2 looks stock. I thought that it used simms for the memory. Where are TOS chips located ?? ect.....

Please e-mail info to me at:

ggorman@crankys.com

Thanks in advance....

I'm having a tough day. For past few days I've been fixing a Mega ST4 with tweety board sound upgrade, Tos 1.4, and an ICD link host adaptor. This afternoon I finally got it all together on my desk and it started crapping out on me. It displayed the following symptoms at random:

-would freeze with 2 to 18 bombs on the screen
-would reset at ramdome points during boot up process
-would not start when powered up and screen remained blank
-would crash at random lengths of time after it starts up with 2 to 18 bombs and some random horizontal lines on the screen

What been so frustrating is I've not been able to isolate the problem.
No loose cables, IC's or discrete components. tried with and without
the host adaptor and hard drives. even tried replacing cables with no
change in the outcome.

Does anyone have Gen-Edit Templates and *.cnx files for the Korg X5DR?

Thanks
Dave

I gave my Atari ST to a neighbor's kid and it is no longer available to me. I thought I had copied all the files to PC format first, but have misplaced the files. I have some files I need on an ST disk, but can't read them. I tried Norton to add the boot sector, and Norton hung. Does anyone have a utility that writes the boot sector without destroying the data?

Thanks in advance,

Pat Coffey

Does the system run long enough to be able to load and run a memory
test program?

The lines on the screen would make me suspect a memory problem.

Is this an original 4 Meg system, or was it upgraded from a 1 or 2Meg?

BobR

My ancient 1040ST is failing. I'd like to have a few more for when this one dies. I have already ordered one from a guy who read a previous message here from me. And I just emailed one guy offering some Ataris a few weeks ago.

But I'd like a few more. I'm also seeking the black and white monitor.

By the way, the problem I'm having with my system is that often the built in floppy doesn't work. I think it will fail soon. Are they replaceable? Does anyone have a drive they can sell me that will work?

Reseat all chips or even better remove and use very fine emory paper or
nail file to clean the chips pins. I suspect MMU or Glue.

Oh yeah, check the 5v supply to the board is good, should be in 5%
tolerance I think.

I got this mouse but do not remember the name of it. It has two sides but they kind of stick out where you can click on them easier than a generic mouse. They are smaller than most mice and use a Xerox paper to work properly. They seems to only respond to this type of paper even if you made a copy of it.

The original paper seems to have a sort of a rough edge to it that makes the mouse move so well. And believe me they work very well. As a matter of fact they seem to work better than any Atari, PC or Mac mouse I've ever come across. I call this mouse The Rolls Royce of computing.

Anyone else heard about them? I am hoping I can find that paper they slide on and if I do, out goes the Atari, Golden Image, Beetle and any other mouse I've been using!
Well not quite LOL! I'll just keep them as backups.

Any help will be appreciated.

Thanks everyone!
Dave H.

Hi all,

I've been asked to attend to a Falcon which boots straight to a lo-res desktop, ignoring the internal IDE. The owner reports a "Data in drive A may be faulty" message when she tries to run anything from the floppy.

I'm betting that (after a visual check of the data cabling etc) it'll be a faulty floppy drive, but if anyone has any other ideas?

The ultimate aim is to rescue data from the IDE, which seems healthy enough in itself, making the right spinning up noises and such.

Any thoughts? I'm on my way Saturday AM...

The simplest answer would be to take them to someone with an ST, copy the
files off the disk, reformat with a PC compatible scheme and re-write them.
Where in the world are you, maybe someone local is watching and can offer
help.

If it has been handled much, the mechanical strains (twisting and bending of the PCB while it was dismantled and handled for servicing) might have made some cold solder joint go completely bad, or else a pin of some socketed chip may be loosing contact. It has happened to me, with similar symptoms. Of course, there is also always the possibility that something is -really- wrong, i.e. some chip gone bad. Try running some sysifo program and see how much memory is reported. Try running some RAM test program too. You may discover something to point you in the right direction.
Try extracting the socketed chips a millimetre or so and press them back into sockets. Try gently tapping on chips in various areas of the PCB and see if you can cause a malfunction.

Oh, another thing: Measure supply voltage ON THE PCB (not on the power supply) with a good voltmeter: there should be +5V +/- 0.1V or so and also +12V, and without any significant AC component.

Hi,

I've been considering doing a cache upgrade for my STFM but I've hit a problem. I was going to base it on the MACH16 but use some cache off an old 486 motherboard. I would have got 64kbytes of L2 cache which is plenty using 32k*8 sram and a smae size TAG ram.

I looked into the 486 motherboard manual to find which chip was the TAG ram and downloaded the datasheet for it. It turns out that this chip doesn't have the /HIT and /CLR pins that I expected. It looks just like a normal SRAM!

So where do I get a cache TAG ram from, I hear it is difficult getting them for the PAK (I read this while searching group archives).

I'm guessing the /HIT function is just comparing the TAG rams data with the address the CPU is putting onto the bus. If it really is that simple I could put it into a GAL I suppose. I also imagine that this was all handled in the 486 chipset.

I also imagine CLR is to flush the tag ram completly, is that correct?

Thanks.

I've acquired a Mega ST2. When I opened it up, it only has 2-TOS chips (1987). But there are six sockets. I pulled the two chips and installed a set of 6-Rainbow TOS chips. But the system will not boot.

Now I know that there are 2 and 6 chip sets of TOS. But why are there six
sockets on this motherboard ????

I'll probably have an STe for sale this weekend - but you've forgotten to say
what country you live in.

Somewhere to the West I'd guess from your time-zone setting.

OK, I don't own the Mega but I do own an STFM which also has 6 ROM sockets. Look around the board near to the ROMs and you should find some solder pads that have 256K and 1M next to them. Unsolder the 1M ones and place solder across the 256k ones. I have three of these on my STFM, I would imagine the same as the Mega ST.

That should make it work!

I had a ST do the same thing. It turned out there was some loose chips
on the motherboard. Probably the same thing in your case. It looks like
to me that it could be the MMU chip or else the memory chips.

Correct. The usual PC chipsets have the comparator integrated in the
chipset, so the tag ram is just a normal SRAM, although it needs to be a few
ns faster than the normal RAMs.

(The PC chipsets had part of the TAG RAM integrated, so the external 32k*8
RAM was not the complete tag, but more a "tag expansion ram").

>So where do I get a cache TAG ram from, I hear it is difficult getting
>them for the PAK (I read this while searching group archives).

Not from any PC board I know.

You need two IDT7174 or equivalent (I think SGS made them, too - MK7174 or
something like that, www.st.com).

>I'm guessing the /HIT function is just comparing the TAG rams data with
>the address the CPU is putting onto the bus. If it really is that simple
>I could put it into a GAL I suppose. I also imagine that this was all

Probably - although it might be a bit big using GALs. I would recommend some bigger CPLDs, like ispLSI 2032 or 2064 from Lattice.

>I also imagine CLR is to flush the tag ram completly, is that correct?

Yes. You would have to emulate that somehow.

On some PC mainboards, flushing the cache was done by software in the BIOS before enabling the cache. However, on a ST, you have to invalidate the cache after every DMA access (since you can't snoop the bus for the new data), so you will need some mechanism which really clears the valid bits for the whole cache in one single step.

Performance wise, it would be easier to add Alternate RAM and let the CPU access that with the full 16MHz (or even overclocked 36MHz - I did this once with a modified MagnumST RAM board - the machine was faster than a PAK-3 with a 36MHz 68030 plus cache, which had no alternate RAM. It is amazing what a 68HC000-16 will do without getting a bit warm!).

Hi Michael!

>You need two IDT7174 or equivalent (I think SGS made them, too - MK7174 or
>something like that, www.st.com).

Yep, those are the ones that the Mach16 uses. I did actually want larger ones (32k*8). I remeber looking for those years ago but found little. Even an email to IDT said they never heard of them!

>>I'm guessing the /HIT function is just comparing the TAG rams data with
>>the address the CPU is putting onto the bus. If it really is that simple
>>I could put it into a GAL I suppose. I also imagine that this was all
>>handled in the 486 chipset.
>
>Probably - although it might be a bit big using GALs. I would recommend some
>bigger CPLDs, like ispLSI 2032 or 2064 from Lattice.

Yeah, nice things they are but I can't afford the costs for thw whole setup. I imagine you could do it in one GAL OK. 8 address in from TAG RAM, 8 upper address from CPU, do and AND on all of them and get a resultant /HIT I think. Even a 16v8 would do that, just.

>>I also imagine CLR is to flush the tag ram completly, is that correct?
>
>Yes. You would have to emulate that somehow.

Problem is you have to clear all the TAG SRAM. The only eas way I see is turning it off and on again. Unreliable and probably waste quite a bit of time. Otherwise you'd have to go through every location clearing.

>Performance wise, it would be easier to add Alternate RAM and let the CPU
>access that with the full 16MHz (or even overclocked 36MHz - I did this once

>what a 68HC000-16 will do without getting a bit warm!).

Serious? Hopefully I have a 68HC000 16Mhz being shipped over from America, I heard these were made from Silicon to do 33Mhz no problems but they were marked up as 16Mhz for some silly reason. Anyway, with me getting into GALs maybe I could do a simple RAM controller in one.

I have to make a PLCC to DIP converter for my CPU to fit in the STFM so I will leave a header with address, data and some control and clock signals for whatever I need.
I believe the Mach16 works with waitstates to the ST board which should be a bit more reliable and faster than switching the clock over.

Is the GAL fit in a socket so I can take it out and in again ? Will check.
BTW I've searched in my old files and only found projects for 1.44
modification in ST computers, nothing about the MegaSTE, I think the GAL
listings should be available around, I remember years ago I also tryed to
find those things and found help on the net, while it was very hard to find a
GAL programmer in my zone.

Let's ask in comp.sys.atari.st.tech

>set of 6-Rainbow TOS chips. But the system will not boot.
>
>Now I know that there are 2 and 6 chip sets of TOS. But why are there six
>sockets on this motherboard ????

Did you also change over the solder bridges for the TOS? I did
when I upgraded my ST from 2 to 6-chip TOS 1.04. I *think* They
were marked A16 and A17,and had solder bridges for either 256K or
1M. After this conversion, some photos I took both before and
after expanding memory from 1 to 2.5 MB show that mine were on 256K,
which seems illogical. Presumably something similar applies to the
Megas.

But according to an old /Atari ST User/ (which shows a completely
different board to mine!) a small chip has to be removed from the
board and replaced by a wire link. Unfortunately they don't tell
you the name of this chip! A photo shows its location next to the
large square chip to the right of the ROMs and just inside C52 (on
an ST).

They also say that two resistors have to be changed over so that

they bridge the first and second pads rather than the second and
third. I *think* these may e 0 ohm reistors so a wire or solder
bridge should do. They are at the very edge of the board next to
the removed chip, marked 'W' something-or-other (one may be W6).

HTH

Why would you want larger *tag* RAMs? Two cascaded 7174 should provide ample cacheable area.

A 74F688 would do the same and probably cost less. Nevertheless, you will need some GALs.

No, not in one 16v8/20v8, even if you use external 74x157 as address multiplexers.

The MagnumST used a MACH210, and that had not much space left in it. An
ispLSI 1016 or 2032 might do, otherwise, you will need a lot of 16v8/20v8
and loose many pins due to needed interconnects.

>I believe the Mach16 works with waitstates to the ST board which should be
>a bit more reliable and faster than switching the clock over.

It depends how you do the clock switching. The 36MHz 68000+RAM mod I
mentioned used some logic (which filled an entire PALCE22V10) to switch
between two asynchronous clocks (8 and 36 MHz) without generating glitches.
That worked just fine. If you have synchronous clocks and do the switching
right so not to produce glitches, that should be easier.

For the electronics hobbyists among you, the very useful German
ATOS on-line magazine has just announced (in translation):

Pinatubo 2.4: now Freeware
by Thomas Kerkloh

The Pinatubo version 2.4 has been published and is now Freeware.

Michael Schwingen has released Pinatubo 2.4 - the driver and GEM
interface for Eprom programmers - as Freeware. It supports
Junior-Prommer, Easyprommer and the 'Vesuv' from Rossm�ller.
Pinatubo supports Megabit and 16-bit Eproms (with suitable

adapter) as well as EEPROMs and 875x/895x Microcontrollers
for all Prommers.

Hardware requirements:
ATARI ST/e/TT/Falcon or Mac with MagiCMac/McSTout, Eprommer (see above)

Download: http://www.ccac.rwth-aachen.de/~michaels/

****
* Acknowledgement to ATOS on-line magazine *

Hi Michael!

>>Yep, those are the ones that the Mach16 uses. I did actually want larger
>>ones (32k*8). I remeber looking for those years ago but found little.
>>Even an email to IDT said they never heard of them!
>
>Why would you want larger *tag* RAMs? Two cascaded 7174 should provide ample
>cacheable area.

I thought if I use a 32k*8 tag I get 15 addresses for the lower 1-15 address and the upper 16-23 make the 8 I/O for comparing. It's all in one chip so it'll keep things simpler. I could use those 7174 but they do seem difficult to get, I'll have a harder look.

>A 74F688 would do the same and probably cost less. Nevertheless, you will
>need some GALs.

I've only just realised that part existed!

>>>with a modified MagnumST RAM board - the machine was faster than a PAK-3
>>>with a 36MHz 68030 plus cache, which had no alternate RAM. It is amazing
>>>what a 68HC000-16 will do without getting a bit warm!).
>>
>>Serious? Hopefully I have a 68HC000 16Mhz being shipped over from
>>America, I heard these were made from Silicon to do 33Mhz no problems but
>>they were marked up as 16Mhz for some silly reason. Anyway, with me
>>getting into GALs maybe I could do a simple RAM controller in one.
>
>No, not in one 16v8/20v8, even if you use external 74x157 as address
>multiplexers.

But the Magnum had to work for many different types of simms and it also managed to fill lots of gaps in the memory map which must have taken up quite a bit of space inside. When I said do it in one, I didn't mean in *one* GAL. :) I'd be quite happy with 8MB extra FastRAM in my ST! If you use something like a shift register then you can get taps off it for DRAM timing or something like that.

>>I believe the Mach16 works with waitstates to the ST board which should be
>>a bit more reliable and faster than switching the clock over.
>
>It depends how you do the clock switching. The 36MHz 68000+RAM mod I
>mentioned used some logic (which filled an entire PALCE22V10) to switch
>between two asynchronous clocks (8 and 36 MHz) without generating glitches.
>That worked just fine. If you have synchronous clocks and do the switching
>right so not to produce glitches, that should be easier.

Yes, I guess so. I should be able to design a small circuit with GAL to switch from ascynchronous clocks, if my system is at 50Mhz, then 50Mhz is a bit too much for the CPU and 25 is not enough so I think async will have to be used. The reason why I mentioned doing waitstates is because IIRC CT2 revA switchs the CPU down to 25MHZ to access bus and revB uses waitstates. Quite a significant speed increase in board access was achieved with revB.

Yup, GEMAR is fine. It is available at most ftp sites. You just need to make sure that you have SCSIDRV.PRG (in the distribution pack) in your AUTO folder. There IS another ST utility whose name I have forgotten (Diamond Back perhaps) which will drive SCSI tape streamers but I was always quite happy with GEMAR.

Hi,

I have a small plastic connector holding a colourful ribboncable in place on my ab040 board, it goes from underneath the board and fits right between the 2 "connectthru" things for the expansionport. This prevents my

NOVAadaptor to fit 100%, it takes alot of fiddling around to get it working once it slides out of place.
Does anybody know what this ribboncable is for? Apparently it only exists on some boards, not all.

cheers!

/Fredrik

You could try running CheckFat on this partition, and post the results here (or by private e-mail) in case you don't understand the German messages. CheckFat will - as the name suggests - only check for errors, not repair them. But in case it finds something, the output will help in correcting the problem.

You can download CheckFat here:

http://homepages.tu-darmstadt.de/~gryf/software/cfat_r4.lzh

After unpacking, simply run checkfat.ttp with the partition letter as
the only argument.

Ciao

Thomas

Looks like a converter to connect a certain conrad electronics DCF-77
receiver module to the joystick port.

Hi Derryck!

Many thanks - received, decoded and unpacked OK.
>
>Hope it all works for you! :-)

When I get time to try it out!

Anyone know where I can get the instructions and/or spec sheet for
the DAT drive? It is a Model C1533-00150, British-made, and when
you take it out of its case the drive has 8 DIP-switches
underneath, which are currently set 1 & 3 OFF, the rest ON. No
idea what they do! The only external controls are SCSI ID,
termination on/off and a power switch. I believe HP have a
web-site but don't have the URL. Anyone help?

Regards, /Peter/

>sure that you have SCSIDRV.PRG (in the distribution pack) in your AUTO

Not needed if you use HDDriver of course :-)

Although I do find scsidrv.prg to be quite useful at other times, for example
if I want to use my scanner and it hadn't been switched on at bootup time.

In uno strano messaggio del 14 Aug 01 Ekkehard_Flessa@WUN.maus.de
(2:333/608.1) scrisse al povero All :
 MD>> Does it work with MagiCMac ?

EF> I don't know. But couldn't you use tools on the Mac side instead?

Not on Atari partitions, I'm still using an Atari formatted hard drive in the Mac, as I took it out from the TT. I suspect (anybody tested?) those partitions are faster then bassing by the MacOS filesystem. Another problem is I can't make symbolic links work of Mac partitions, any fix ?

If you tell me the performance difference is very little and find a way to make symlinks work on the Mac partitions I would be very happy to share all the drive on the Mac partitioning for the Mac and seeing with MagiCMac too, that would be much more flexible then now, also for backups and to use all other disk functions, that is sharing on the network, use disk repairing tools, backup software and so on.

Ciao, ** *Mike* ** www.interware.it/users/mike/ mike@interware.it

I am considering taking on a project of placing an Atari Mega ST or Ste in a PC case. I'm curious to know if anyone else has done this and how difficult it is. I am not afraid of soldering or otherwise reworking a case.

I am planning on using a Mega because of the seperate keyboard.

My main question for now is about the power supply. Do I have to do

anything about changing the standard voltages from the PC style case.
I have an old 286 type AT style case or might try and put it in a
newer case if the motherboard will fit.

You don't need SCSIDRV.PRG for that. If HDDRIVER is installed all that
is needed is a bus rescan before starting the scan application. Good
scanner software would even offer a bus rescan option of its own. Please
refer to the manual for details.
Also note that it is not a good idea to use both the SCSI driver of
HDDRIVER and SCSIDRV.PRG. You will lose certain functions this way
because SCSIDRV.PRG only supports the old SCSI driver specification
1.00, but HDDRIVER supports version 1.01. If both are installed you
effectively only get version 1.00.

I found a data sheet for mine by searching on Google, but it didn't say much really, and as I said before I didn't bother keeping it, and I don't think that mine is the same model as yours.

>you take it out of its case the drive has 8 DIP-switches
>underneath, which are currently set 1 & 3 OFF, the rest ON. No

One of the text files in PAR folder of the GEMAR distribution lists some settings for another HP DAT drive, but none of them are the default settings from what I recall.

>scanner software would even offer a bus rescan option of its own. Please
>refer to the manual for details.

ScanX does indeed offer a bus rescan for this purpose, but unfortunately it
always crashes out with a pesky exception error. I suppose it's down to my CT2
board, so I'll live with it, not a big deal in the wide scheme of things.

>Also note that it is not a good idea to use both the SCSI driver of
>HDDRIVER and SCSIDRV.PRG. You will lose certain functions this way

Understood, thanks.

This might also have to do with a bug in older versions of HDDRIVER. It
would help analysing this if you ran a short test with the current demo
version.

I have a ST in a PC style case. The computer itself is not in the case, but only the drives (hard drive, disk drive and CD rom drive). The power supply is there also. I am afraid I am not sure how it was done, because a friend of mine who used to work on Atari computers did it.

I've run as many tests as I can think of - it's not down to my CT2 card, but ScanX simply won't rescan the bus without that exception error unless I run scsidrv first. Even running hddriver.prg from the desktop isn't good enough!

Must be a programming error in ScanX, although I've never read of anyone else with this problem which I've mentioned in the past.

Thanks for the support anyway Uwe.

If you have a bit more time to spend on this, please start SYS_MON and SCSI_MON before you start the bus rescan, which causes the crash. This might help to track down the problem. Either the crash appears in the call that rescans the bus, which means it is a bug in HDDRIVER, or it is after the scan, which means that it is most likely ScanX that does something wrong.

Something I forgot in my previous posting: Please check whether your
machine also crashes when you do the bus rescan within HDDRUTIL. If it
does not crash this is a proof that ScanX does something wrong. But if
the rescan works I strongly recommend using the bus rescan in HDRUTIL
instead of starting SCSIDRV.PRG instead.

Well I have it hooked up to a STe and the STe is being powered by it's
own internal power supply. However, if I hook up a regular 520ST, it
can be powered up by the PC case. At the time it was made I was mainly
using a 520 1meg ST. My friend asked for the power supply. He took it
apart and attached part of it to the PC case's power supply. So now I
```

have a 520 power cord coming out of the case. I would think the wires
from the case could be connected to a STe in some way...

In my Mega ST manual it is stated, that the power supply delivers
 +5V @ 3A
+12V @ 1A
-12V @ 30mA

PC power supplies have much higer amp-ratings.So there should not be any problem.The 4-pin connector for Harddisks has +12V (yellow) and +5V (red). The P8/P9-connector for the Mainboard also has the -12V Line. It should be the blue line, but better test first :-).

Regards, Michael

I have a 45 MB supradive with connections for SCSI and Atari style drives. I tried just pluggin in a ZIP drive to the SCSI port, but my ST couldn't see the drive. Is there more I have to do? Do I have to open up the supradrive and switch anything to make the SCSI port active?

Any advice is appreciated.

Eric.

Yes this is correct, the amperage delivered by the PS should be the same or higher than whats needed by the computer. This won't be a problem. the only problems are when the voltages are wrong (ie more than 1 or 2 volts in most cases) or the current supplied is too low.

Hello Eric,

Here are some things to check on. First see if the 45 meg drive mech is terminated (since it was the only drive originally it probably was), you should be sure it is not terminated so that the computer can find any drives on the scsi chain after it. The zip drive (which is now the last drive) should be terminated to work properly. Also check the hard disk driver software to be sure its configured to scan the scsi id's used by both the 45mb drive and the zip drive.

The power supply in the PC case will deliver the exact same voltages needed for the ST.

The connectors on the PC power supply will fit any drive you put in the case- floppy disk, hard drive, CD-ROM, etc.

You will have to either solder the +5 and Ground leads from the PC supply directly to the ST motherboard, or work out some kind of connector if you want the power supply to be easily removable.

The exact location where the ST power supply connects to the ST motherboard will vary, depending on what model you're using, but it's fairly obvious.   Measure the voltage from each lead of the ST power supply just to be certain, and mark it on the ST motherboard.

Then you'll need to cut off the Molex connectors on the PC power supply that normally go to the PC motherboard and solder them into the same positions on the ST motherboard that the ST power supply went to.

To make the connection to the ST motherboard removable, you'll need to buy a PC power supply adapter that as a FEMALE connector on it.

Get a "power supply extender" or a "power supply Y adapter".

Cut off the female connector, leaving a few inches of wire attached.

Solder the wires from the female connector onto the ST motherboard.

Now solder the MALE connector from the adapter onto the PC power supply motherboard leads, then plug the male and female connectors into each other. This will let you remove the PC power supply easily if it ever becomes necessary.

Is that a Tape drive? If so Diamond Back 3 will work fine also. Gemar should be able to be downloaded for most any ftp Atari site. I think that is where I found it. Try the sites below:

I've now got a printout from SCSI_MON which lists three attempts to open the ID of the scanner. I'm not qualified to understand the results, each attempt ends with a

-> -37

if that helps any.

Your other suggestion of using HDUtil to rescan the bus also doesn't work - I still get the dreaded error 69 from ScanX :-(

Ah well.

I don't know this by heart, I will look it up.

> Your other suggestion of using HDUtil to rescan the bus also doesn't work - I
> still get the dreaded error 69 from ScanX :-(

If I understand you correctly, HDDRUTIL does not crash when re-scanning the bus? This is a strong indication of a bug in ScanX. At least it cannot be a bug in the bus rescan code of HDDRIVER, because in this case HDDRUTIL should also crash.

Thank you for running these tests.

What's wrong with the design of that German guy ?
He did that and fixed steprate, all in one GAL+74LS221.

Unless he is selling that for considerable $, there is not much reason for
doing it once more...

>
> Would it be hard to implement the needed code in a GAL and make this

This circuit is so simple, that making special PCB for it is waste of time.
It can be wired faster than one would etch board...

 e> up the supradrive and switch anything to make the SCSI port active?

I have the 44MB cartridges SupraDrive from a long time, and I was NEVER able to use the scsi DB25 port to connect anything, BUT it is very simple to open the (heavy!!) case and use the internal host adapter to connect SCSI devices. The adapter is on a PCB board where the DMA ACSI cable comes in from the Atari computer, then you have two SCSI connectors, one 50pins is connected with a short flat cable to the drive (that is terminated), the other connector is 25pin and goes to the extrernal DB25. Changing setting and terminators and configurations never let me use the DB25 port, I also replaced the host adapter 2 times (good and fast Supra service) because I damaged it (pay attention with the unshielded power supply of the SupraDrive, just below the hostadapter), tryed with different drives, but never worked, so I suspect there is an error in the project.

BUT if you use the 50pins connector all works ok for 7 SCSI devices. It was easy for me to do it the easy way, connecting a longer 50pins flat cable to the host, then to the internal drive and come out from the metal case leaving just that 1mm space between case and cover, then put a typical SCSI centronics 50pin connector crimped to the cable. Remove terminators on internal drive and use an external terminator at the end of the chain.

Thanks for the info. I will probably cut the connector from the Atari
power supply or look through the parts box to find a plug that will
work. I have a mid tower case that the motherboard will fit in. I
may start this project in the next week or two. I was originally
thinking of waiting until later this year, but now am getting the itch
to get started.

Anybody can tell how you can use the Templemon debugger ? I am able to install in in MagiCMac, but then I do not know what are the commands, and the german readme is not so rich, I've just found "ES" command exit magicMac and "G" restarts execution, but what is the command to simply stop the buggy application ?

-37 is one of the SCSI driver's error codes and means "Invalid Handle".
This is comparable to an invalid file handle. Looks as if ScanX uses an
invalid handle and does not care for any error messages that result.

His site has gone but he still provides help when possible. I don't know
about this particular product.

Bye,
/Pascal/

Hello there I'm looking for a non functioning, but repairable of the following
Mega Ste (mangled ok)
TT (totalled ok)
Falcon (wounded or dead)
I of course already have a collection of accessories (except DMA->SCSI or HD hint, hint). So i'm not interested in complete systems. But motherboards without chassis etc. is of course negotiable.

Just be carefull that the 12v line doesn't touch the 5v line if you do that.

Don't use sellotape like so many people I know do!!

Tim

Thanks Ed! Derryck kindly sent it to me. I am a bit surprised that
Diamond Back will work with it, as Diamond Egde, for instance, has
problems with large partitions and also does not support long file
names, I believe. Does DB3?

Regards, /Peter/

Is anybody ever try one of those in a TT or MSTE :
http://www.voxtechnologies.com/vme_network_boards.htm
I don't know the price but they're based on the "lance" controler....
this could be a good alternative to the lack of VME Ethernet card on
Atari.

> > Omikron Basic.
>
> What was "Omikron Basic" like?

Omikron Basic can use libraries (there were a lot of them e.g. the
Easy-GEM-Lib), can run with or without line numbers and has a
pseudo-GEM-Interface. However, at that time GFA-Basic was already too
popular. Omikron is more similar to the classic basic.
There was a version 5 with a GEM editor and horrible looking dialog boxes.

>
> All the ST language discs (admittedly either UK or US oriented) I've

> Logo.

I forgot to mention that the decision to replace ST-Basic with Omikron was
made by Atari Germany - maybe because the Atari market in Germany was
different to the UK/US one.

I also want to connect a scsi ZIP to an Atari 1040STf.
I have a scsi ICD adapter w/ software version 5.6.1
My adapter sees the ZIP scsi ID#5 on boot up and
can format the ZIP using ICDFRMT. However, every time I try
to partition it, it gets errors and says to reformat the ZIP.
   I tried downloading and using the HD Driver Demo, but
it can't recognize the media on my primary scsi drive and says
the media is corrupt and won't let me even get to the process of
formatting the SCSI drive.

Question#1-Will the full version of HD Driver work with my scsi ICD
adapter, or do I have to buy a Link adapter?

Question#2-Will HD Driver with ICD adapter let me format the ZIP
so it is compatible with IBM and Atari?

Question#3-Is there a later version of ICD drivers that would solve my problem?
If so, what is the latest version and where might I get it? (Mine is 5.6.1)

Question#4-ANyone know of a list of Manufacturers of Atari compatible
scsi II drives? (I just bought an IBM 2.1 Gig scsi II fast-wide that

won't be recognized by my ICD adapter)

Question#5-Is it possible to disable parity checking with the ICD drivers
through software?

Thanks
Matthew Walter

> formatting the SCSI drive.

If the media is recognzized to be corrupt note that the full version of
HDDRIVER will also say so. Typically this is a cable or termination
problem. Whatever it is, it is most likely a hardware problem.
You cannot format with the demo version because the demo is restricted.
Please refer to the README for more information.

> Question#1-Will the full version of HD Driver work with my scsi ICD
> adapter, or do I have to buy a Link adapter?

It will work without restrictions.

> Question#2-Will HD Driver with ICD adapter let me format the ZIP

> so it is compatible with IBM and Atari?

Not format, but partition. Formatting is irrelevant, partitioning is what makes the difference.

> Question#3-Is there a later version of ICD drivers that would solve my problem?

No, There is no driver except HDDRIVER that supports partitions that are both PC and Atari compatible.

> Question#4-ANyone know of a list of Manufacturers of Atari compatible
> scsi II drives? (I just bought an IBM 2.1 Gig scsi II fast-wide that
> won't be recognized by my ICD adapter)

Any SCSI-II or SCSI-III drive can be connected to the Atari. Note, however, that you need an adapter (16 to 8 bit) if you want to connect one of the current UW/160 drives that have an 16 bit SCSI bus. This adapter is nothing specific to the Atari. Also note that some drives may require initiator identification and thus require a LINK96 adapter. But as far as I know this is only required for some Quantum drives.

> Question#5-Is it possible to disable parity checking with the ICD drivers
> through software?

No. The only drives where you can switch parity off by software are Quantum drives. You need special software for doing this, which is included in HDDRIVER. But even with these drives and the right software you have to connect your drive to an Atari that supports parity in order to reconfigure the drive. With a host adapter not supporting parity you cannot do this because the precondition for the drive to be accessible with this adapter is that parity is already switched off.

What happens after an additional reset? Is the drive seen then?
When I bought my IBM hard disk it could not be recognized at power-up,
until a reset was performed. It turned out to be a matter of configuration-
a jumper had to be set differently ("disable unit attention at startup",
if I remember correctly).

In fact, it still happens sometimes that this drive's ID is not seen when the
bus is scanned for devices present (not that I have much need to do that).
Different software behaves with various success here (ICD, Hushi,
HDDriver-demo) However, the drive always boots OK now.

>just the Seagate (ID#0).

I suppose it has been checked that the IBM drive has a different ID?

This means that something is wrong with your hardware, in particular cables or termination. Things like that do never happen with a machine where everything is in order.
The main problem here is that when a drive is not always correctly recognised when booting it might happen that the drive will not be recognised anymore during another operation, e. g. when reading or writing data. If that happens data can get corrupted. That's why you should never be satisfied with a setup where things sometimes do not work correctly.

Hi

I recently bought a Comapq SCSI drive 2.1gig from a radio rally (don't do it guys!). I installed it in a 5.25" drive bay with good cooling. It worked OK so I partitioned it with HDDriver to one partition as HDDriver said that would be OK with TOS 4.04 and Magic. TOS 4.04 worked with it, Magic 6 (no FAT32 support with this verson) didn't. I left it a while and partitoned it to 3 smaller drives to please Magic. I did a sector test and it passed with no bad sectors. After about an hour it would sound like it was slowing down a bit.

After a while (read 2 days) it lost the partiton info and so I decided
to partition it again. HDDriver said "couldn't read root sector" so I went
to format but still the same. I tried AHDI and the same. I've changed
the jumpers but it doesn't help.

It's rather noisy, double height, Compaq C2490, also made by HP. It did make
some odd noises, like an angle grinder sometimes, but this maybe
just the "features" of this fast drive.

Shall I buy a cheap ISA SCSI card to do a format using PC tools or take it
apart for the great magnets inside?

Thanks.

HDDRUTIL says it is not OK to create TOS compatible partitions of more
than more 1 GB regardless of whether you are using MagiC or not. There
is no operating system for the Atari that supports TOS compatible
partitions of more than 1 GB. Even TOS 4.04 does not do this, even
though it looks like this on first sight. But there is at least one
known bug in TOS 4.04 that prevents partitions larger than 1 GB to be
used reliably.

> Shall I buy a cheap ISA SCSI card to do a format using PC tools or take it
> apart for the great magnets inside?

There is no difference with PC tools. You cannot format a drive in
different ways by using different tools. The only things these tools do
is sending the SCSI FORMAT command to the drive. The rest is completely
done by the drive, regardless of whether you are using tools on the
Atari, Linux, DOS, Windows, Mac, Solaris, SGI, ...

Version 7.80 said "This partitioning scheme is only valid for TOS 4.04,
Big DOS, Mint and Magic" as you click OK. It then says the usual "are
you sure". The size was 2107Mb as it said in HDDRiver and in the drives
online manual. This one partition did work from TOS with no extensions, but
Magic it didn't. Whether it was reliable under TOS I didn't get to see, but
HDDriver certainly warned me that TOS 4.04 or Magic only for a partition
over 2 gig. Do you have HDDriver 7.8 to hand?

I guess something is dead in the drive. One last try and I'm getting
the lovely Cobalt magnet out.

Maybe old versions say so, but this is not correct. I will check this
with the current version.

> online manual. This one partition did work from TOS with no extensions, but

I guess the capacity of the *data* sectors was less than 2 GB. Otherwise
it could never have worked. You can easily calculate that it is
absolutely impossible to have TOS compatible FAT partitions with more
than 2 GB. And as already indicated, even with TOS 4.04 partitions
greater than 1 GB do not work properly.

> Magic it didn't. Whether it was reliable under TOS I didn't get to see, but
> HDDriver certainly warned me that TOS 4.04 or Magic only for a partition

Yes, I could check this. But please see above: I will basically check
the behaviour of the current version.

> I guess something is dead in the drive. One last try and I'm getting
> the lovely Cobalt magnet out.

BTW, it is always a good idea to give another platform a last try. My
posting might have sounded differently. What I basically wanted to say
was that if everything is working properly it does not make a difference
which software you are using to format a drive. But, of course, software
can have bugs or the computer hardware can be broken, but the drive may
still be OK.

You may have to get HDDriver. How is the drive partitioned? What SCSI number is the drive? What about termination? If the 40meg Seagate has the termination activated, then chances are nothing else will be seen in the chain.

Gett HDDriver. It supports the Zip and Jaz drive & does a very good job at time. Works well for me when I use my Jaz drive.

I just bought a 3 gig SCSI drive. I partitioned it into one big
partition and Magic recognized it fine. The only problem was that
Kobold 2.5 did not like the big partition.

Could anyone point me at a technical description of the format of the information in a DIM disk image file? I'm interested in writing some code to create a real diskette from a DIM image using a PC. (I would use Fast Copy Pro on my ST, but my ST has no hard drive and Fast Copy Pro insists on using one when restoring DIM files to diskettes...)

Is there any software that already exists that runs on a PC and can create a real diskette from a DIM file? Including unusual physical formats? Which ST emulator (if any) has really good mapping of ST physical diskette accesses to real PC diskette drives?

Thanks in advance!

John

P.S. Even if there is already a program to help me, I'd still like to know about the DIM file format details...

>still be OK.

Well, I seem to have found the problem. For some reason which I haven't had
enought ime to figure out, it's conflicting with my Toshiba CDROM with ID3
with HD on ID 0. So if I remove the ID3 from the "devices and partitons" the
drive works OK but I think it corrupts the data. Very odd, but I also have
to check out the termination and various options.

Concerning termniation, on the drive it says "Terminator Disabled" near the jumper. I guess that means put a jumper there to disable termination, but here is the doc for the HP version:
http://www.hp.com/cgi-bin/cposupport/get_doc.pl?
SNI=hpsurestor9696&LC=information_storage&Tfile=lpg61019
Says the opposite :/

Also what is the SDTR message? Sorry for all the Q's.

Thanks, I'll probably try fiddling with various ID combinations.

SDTR = Synchronous Data Transfer. This is not supported by the Atari hardware. It should not matter whether this is on or off, but off it the safest bet.

Hmm, Are you using the German version which stands at 6.10 I think.
The English conversion only got to 6.01 or something and it doesn't
give FAT32 support IIRC.  I think I need to upgrade soon, especially if
6.20 comes out.  I don't use Magxdesk so having Magic in German isn't
too much of a concern.

The TOS version doesn't matter. HDDRIVER can create dual compatible
media with any version of TOS. The only difference with respect to the
TOS version is that with TOS < 1.04 the maximum partition size is 256
MB. But this is a limit of TOS, which has nothing to do with HDDRIVER
and applies to any partition, dual compatible or not.

There's not lot of Deutch in MAGIC.RAM, it only takes about 20 mins to get
rid of it all.

Hi
I'm a bit out of touch with the Atari scene. A friend has asked me to
source an adaptor to enable him to run a SVGA monitor with his Falcon
I'm planning a trip to the UK in September and would like to know if there
are any dealers in the London area where I may be able to but such an
adaptor
thanks

>This means that something is wrong with your hardware, in particular cables or termination. Things like that do never happen with a machine where everything is in order.

You are most probably right, Uwe. This type of error came to my mind, too.

However, for some reason this erroneous behaviour seems to be limited to id-check only, and in all other aspects this disk has been working silently and reliably for a long time. It always boots correctly and it makes no errors in reading/writing, and I can detect no errors accumulating on it. And proper examintaion of all items which might be wrong hardware-wise would be too time-consuming: the DMA chip (buffering?), cable from the motherboard to ACSI/SCSI adaptor (correct impedance? undocumented termination requirements?), the Ge-Soft adaptor (malfunctioning?) SCSI cable and finally the disk, its termination and internal parameters. I relied on the disk's internal active termination, and about the only thing I might do when I open the box next time could be to disable this termination and try to add a separate terminator on the end of SCSI flat cable. I suspect the problem is disk-related as I did not experience it with some other drives which I connected.

Anyway, when I bought the disk and the adaptor second-hand several years ago I needed them quickly and could not choose much, and I liked this disk because it was extremely silent. As it turned out, I am not dissatisfied.

>The main problem here is that when a drive is not always correctly
>recognised when booting it might happen that the drive will not be
>recognised anymore during another operation,

In fact, this one always boots correctly, and only afterwards the id-check (and only that) may fail. The interesting bit is that different software utilities perform this with various success. ICD's utility practically always recognizes the disk. Hushy id-check utility almost always does NOT recognize it. HDDrutil (v7.6 demo) consistently recognizes the drive when activated for the first time, but not so successfully when "again" is selected.

>should never be satisfied with a setup where things sometimes do not
>work correctly.

Well, this is true, of course, but as I said I could not choose much then.
So I take care that anything of importance is backuped, and carry on.

Thanks for your remarks.

\>>Kobold 2.5 did not like the big partition.
>
\>Hmm, Are you using the German version which stands at 6.10 I think.
\>The English conversion only got to 6.01 or something and it doesn't

The necessary patches to the magic.ram file were published in the Yahoo egroup magic_os a month or so back. The biggest problem with using the German version of 6.10 is that some programs automatically use German dialogs if they detect that they're running on a computer with a German OS.

This can probably be solved by putting a program in the AUTO folder that
sets the _AKP cookie as desired.

I'm having a strange problem with a Seagate 2.0 GIG drive. I'm using a Link II host adapter. The drive works fine on it's own, but it corrupts other devices that are connected, i.e. my CD folders all have garbage text for their names, and when the names will display correctly, most things that I run result in 2-4 bombs. The system works perfectly with my Maxtor 120 MB drive. Sure would be nice to be able to use the larger drive. Can anyone help?

Sounds like bad (too long) cables or wrong termination.

Ted,

I don't think there are really any Atari dealers as such in the UK any
more. Not the sort of place you find selling PC bits certainly.
There are a couple of places that specialize in Atari stuff but many items
need to be pre-ordered etc. Atari Workshop is within striking distance of
London, see http://www.atari-workshop.co.uk/contact_us/contact_us.htm for
contact info, and they do list several Graphics Adaptors but I have no idea
which ones would suit a Falcon. (I just have a Mega II and an STE.) In any
case I would strongly advise dropping them an e-mail well before you arrive
to check they have what you want.

Dave.

This was the first thing I tried to get your beloved driver and tools to
automatically "speak" English (without using the cmd line or the alt
key, I mean). Unfortunately it didn't work. One really need to have the
corect AES version (German or non German) compiled in magic.ram or be
able to patch the file accordingly. This is what I did (the needed
version of magic.ram was not available at that time) and I posted the
method I used in both the above mailing list and (iirc) in csas.

Bye,
/Pascal/

OK, I apologise in advance for this PANIC POST;-).

My Falcon power supply just died, ok I assume its the power supply. I
know this has been posted NUMEROUS times, but I didn't think it would
happen to me.

What can I use for an alternative power supply, if any, or should I
try to locate a powersupply from BEST Electronics, or B&C. Or if
anyone can repair or replace them in Canada, Ontario, Toronto area?

Thanks in Advance Brian.

I see. I guess the problem is that when you change the _AKP content it's
too late because the MagiC AES has already determined the language.
Anyway, you can configure HDDRUTIL to speak either German or English as
explained in the HDDRIVER README.

```

The ICD driver can be configured to skip some SCSI IDs when scanning the bus for devices. This is normally done to speed boot-up. Check that the SCSI ID you are using is actually being scanned. Sorry I can't give you details how to do this, but my ST is currently in bits! There is a useful utility in amongst the ICD software that scans the SCSI bus and reports what's there - I think it's called something like IDCHECK, but it's a long time since I used it...

Hope this helps,

Martin

I had the same thing happend to me with a new external 3 gig Seagate
SCSI drive. Turned out it was a termination problem. The Seagate was
the last device on the SCSI cable and was not terminated. Once that was
taken care of, things are fine.

My atari TT/030's original 40meg just went belly up on me a few days ago, so
I had to yank a 250mb Quantum ProDrive from my spare parts bin=) I have one

problem, I cant get it to be bootloaded, Ive tried AHDI 6.06, but hinstall
gives me two bombs and exits. Next I tried CBHD, no luck either. Can anybody
please help?

This drive should not cause any problems. I suggest that you also run a
test with the demo version of HDDRIVER:
http://www.seimet.de/atari_english.html.

Hi all,

My problem is that I want to use a Jam sample clock (DSP connector)
and a Soundpool Analog 4 (custom connector) together on my Falcon.
Since the clock has no through port I have to put it last in the chain.
So can anybody tell me what pins are really used on an audio clock ?
Then I could compare them with the subset of signals that is available
at the Analog 4 through port and try to make a special cable.

Thanks
Gerhard

Hiya

So i'm not the only person that likes doing these things:))

No the memory isn't worth the trouble, I gave up after my first attempt
and i cut into the legs with a fret saw at that..

I think it would be cheaper for someone to buy a second hand 1040 or
STE!

Hmm... I'll have to check the CD and see if it is terminated
properly. It uses switches. I'll let you know. Thanks

Hello,

in article <996308782-45886AEicMi@08002go.com> (comp.sys.atari.st.tech)
Derryck Croker wrote on Fri 27-07-2001 10:02 (GMT):

> The problem with using the [Alt] key is that it's assigned in jinnee to open
> the file in a viewer, which is not what's wanted!

If you press [Alt] before d-clicking on the app within MagxDesk, you "remove" the desktop. But you can also press this key a (very) short while after the d-click. Maybe this also work with Jinnee. Maybe you can also assign a cmd line to HDDRutil in your desktop. I do not recall when this option was included to the package.

Bye,

```
/Pascal/

I also don't know exactly when this feature was introduced. But this can easily be checked: Just have a look at the README or the online help.

I've got a very ancient program which as been written with a CP/M-68k
compiler, is there any way I can decompile this ?

The program's head is :-

"CP/M-68K(tm), Version 1.2, Copyright (c) 1983, Digital Research
XXXX-0000-654321"

Also, did anyone have the original compiler ?

Cheers

Grazey

I am using an old Commodore 1802 video monitor with an RCA jack video
input to monitor my camcorder output.

It works very well however I need to adjust the horizontal width of the image displayed. The image is too wide.

There are no controls on the outside and there are no internal adjustment pots for horizontal width.

Does anyone know if the horizontal width "can" be adjusted or was it "factory" set? Does anyone know of any schematics for this monitor?

Any help would be greatly appreciated.

Mike Nash

Use a fine tip soldering iron and either a desoldering pump (solder sucker) or desoldering braid. Those rams, contrary to rumor, are not dead common items in every radio shack. I been trying to find some for months and they're always out of stock. They could even be useful for reviving a cramped 520

That -can- be an result of timing touble (32 Mhz clock) or touble with
chip carriert contacts of the rom chip. Last point is easy to fix.
Remove rom chip (with plcc tool) and plug it in again.

Otherways the rom chip is defective. (1 of 200 falcons)

Regards, Robert

It means the TOS chip is dodgy.

>and if it is fixable??

Hmm, never seen EPROMS going bad but you could try looking at the chips to see if it has any physical defects which TBH is unlikely. I don't think the ROM was sockected on the Falcon.

some way to explore:

-you can try to remove and put back the rom chip.

-otherwise, try to boot with normal speed.

-there is a switch(2 points to solder/de-solder) on the motherboard to configure the wait-state for the rom. I think the nemesis documentation speak about that. Try to put back the wait-state to its original state(2 wait-state)

-sorry, your rom chip is dead or has to be burned again.

This is most probably not a bad ROM (except if you burned it yourself), but more a timing or contact problem.

thank you.danke for that information Robert!
I will test out the easy solution first,
otherwise I will order a replacement from BeST(if they have it!)
I assume the timing trouble is because of the Nemesis upgrade.
btw, is this info in your fabulous DO IT pages?
thanks again

This is a bit of a long shot, but does anyone know of a C source for unpacking data packed with PackICE? I have a bunch of old files from my ST I'd like to be able to read on my PC which were packed with it.

I have the 68000 assembly unpacker, but I'd sooner not have to try and port that if I can help it :)

Thanks in advance for any pointers...

Howie

I think so, they had a lot of parts left. I hope it is an contact
problem.

> I assume the timing trouble is because of the Nemesis upgrade.
> btw, is this info in your fabulous DO IT pages?

It contain some about nemesis fitting, most in german. Nobody like to
translate it an i doas�t had the time for.

I get the same error message sometimes after accelerating the DSP to 50Mhz
with a switch. I never get the message @32Mhz but sometimes when I switch to
50Mhz I get the same error but no bombs. I just keep going and everything
works fine.

Joshua.

I have here the assembler source for unpacking routines from packice
2.04. I can send you the archive.

Hi Howie

>This is a bit of a long shot, but does anyone know of a C source for
>unpacking data packed with PackICE?

Ive got assembler source code!, no 'c', cant even spell it myself, cant
think why i spent half a ton on the package?.

Note that this is quite dangerous situation. Let's assume that the chip is not broken but the checksum is wrong because of timing problems when accessing the chip. The fact that you do not always get an error message does not mean that everything is fine. It just means that everything was fine when the ROM contents were checked, which is only done once during the boot phase. At a later stage errors can still occur and you will not get any error messages then. But your system could either crash or destroy data or whatever. It only needs one bit to be read incorrectly, for example, to write (garbage) data to your hard disk instead of reading data. I would not want to use a computer where this can happen. From what you say your machine is in such a dangerous state.

```

Hi guys

I notice on magic online that development of the magic OS is supposedly now on ice. Its not been very obvious that its been anything but for a year or so.

There was rumour of a Magic 7 being in progress but its development was heavily reliant on a certain machine clone being dropped due to the sudden vapourisation of an important custom chip.

I had not heard anything about that. Where did you hear it from? It would be nice to get an upgrade, but I am not sure there would be a Hades version.

Forget an update. MagiC is a dead project. The same with all the other
apps distributed by ASH, ASH mailer, Kobolt, Phoenix, RSM, etc. They are
all history now.

Yeah all versions that Axe/Delight did (v1.9 - 2.4) only came with Assembly depack code.

The best option would be to run either mega-depacker or multi-depacker on an ST emulator (Winston / Steem etc) and save the depacked file to your hard drive.

Also if you have access to an Amiga then the latest xfd library depacks lots of ST crunched files eg. Atomik, Automation etc.

Reminds me of MiNT kernel. The last non-beta version was released in
December 1999 and the last beta in October 2000. Nothing new since then.
Correct me if I'm wrong. I think the last official version of MagiC is
even newer than the last non-beta version of MiNT.

Hi 'Doc'! :)

> Reminds me of MiNT kernel. The last non-beta version was released in
> December 1999 and the last beta in October 2000. Nothing new since then.
> Correct me if I'm wrong. I think the last official version of MagiC is
> even newer than the last non-beta version of MiNT.

IIRC Frank Naumann is the man to ask for that. Maybe he anwers more to
PMs than ASH...

Beste Festplattentreiber-Gr�sse, Werner

PS:(Falls es noch niemand gesagt hat...) Danke f�r dein bisheriges
Engagement und eine hoffentlich noch lange w�hrende Unterst�tzung des Atari-Systems!

Check the CVS changelog...

> Correct me if I'm wrong. I think the last official version of MagiC is
> even newer than the last non-beta version of MiNT.

That's correct. Not to mention N.AES, which hasn't been updated for ages.

>... and ASH wanted to make a MagiCMilan for the Milan II...

Well - they probably hoped that Magic would run on the Milan II without big modifications in Magic (which would probably have worked, since the TOS now provides all necessary low-level functions for MagicMilan) - ie. I would have modified TOS so that Magic would have worked.

But since the Milan II is history, there is no need to speculate who would have done the modifications. However, judging the work on MagicMilan, any port to a new machine that is done completely by Andreas/ASH would take some time, since Andreas does not seem to have too much time left for such projects.

I think so.

But I've got both MagiC 6 and Mint + N.AES and when I see the speed difference between both OSs, it really appears that Mint isn't a solution for my TT.

Maybe we could dream of an 'OpenSource MagiC' ?! That would be a great solution. I think a lot of people would try to boost MagiC... but that's a PURE DREAM... ;-)

Regards...

STonX is also open source and there is no real development anymore. And
MiNT is open source but the latest non-beta version is more than one and
a half years old. There are probably not enough developers or people
interested in these emulations left to really achieve something.

As far as I know it does. The best host adapter (highest compatibility
with SCSI) is the LINK96 or LINK97 by WB Systemtechnik.

> How about software? I understand that HDdriver supports Zip drives: from
> which version (in case someone gets a second hand offer)?

7.00 or newer supports special functions for the ZIP. If you get a
second hand driver be careful that you get it on the original floppy
disk and that you get a written statement from the owner that he has
destroyed any copy. Otherwise your copy would be illegal.
BTW, the current version is HDDRIVER 8, with the demo version available
on http://www.seimet.de/atari_english.html. With an English manual it's
available from Atari Workshop.

> Will such a drive be auto-bootable? Someone who has a zip drive
> connected to his ST tells me that he needs to reboot it after power has
> switched on (warm boot), and some AUTO folder program has to be used.
> Sounds cumbersome.

Yes, any drive with removable media is auto-bootable. The ZIP is nothing
special in most respects. The only thing that is different between the
ZIP and other drives are the built-in auto-spin down and password
protection functions.

Actually, MiNT development is still very active, but maintainers of the kernel and programming library insist one _must_ use CVS to access newer releases. They have turned MiNT into a geek-only toy, without any further release using normal tarballs packages. Granted that CVS is not that difficult to use, but is nonetheless a serious breach of the user-friendliness Atari was known for.

Recent betas indicate an indecent minimal memory requirement that hampers further usefullness on anything less that a 32mb computer with a CPU that supports memory protection: memory protection has become the default modusoprandi and the minimal memory block size was raised in a way that prevents compiling a kernel with 10mb of free ram; GCC dies of memory exaustion half-way thru the process.

Hi Hallvard

>I could use some information on how to set up a zip drive with an ST as
>I've never used one myself.

Open the box, extract the contents, plug into your SCSI chain, switch the device ID on in HD-driver, reboot, use.

>Obviously one needs the SCSI version and an SCSI adaptor. Will any host
>adaptor work?

Yep.

>Does it need to support parity?

It isnt bothered i dont think, mines been lugged into a few systems with no troubles.

>How about software? I understand that HDdriver supports Zip drives:
>from which version (in case someone gets a second hand offer)?

All i beleive

>There's also some talk about connecting a wire to a pin of the joystick
>for power.

New ZIP's i understand provide TRMPWR, but a diode to the relevant pin from a +5V line in the zip will suffice, but if youve other devices on the SCSI chain use one of them to provide power.

>I take it this is the +5V signal needed for SCSI "TERMPRW" at some pin
>of the SCSI unit (pin 11?).

i thought it was 25,

I also have a USB ZIP on't PC, so its really usefull to be able to drag stuff from the Atari for CD backing up or to the Atari following a fast web download.

You just need to make sure that HDDRiver is configured for windows partitions and that the ZIP disks are partitioned to suit TOS and DOS

Hi Hallvard,

>A discussion has come up in the Notator mailing list (see my signature)
>regarding backing up data in a safe and simple way, and someone
>mentioned using zip drives.
>Actually using a zip drive instead of a harddisk because of the much
>lower noise level (which is important for us musicians).
>(then using a harddisk to back up the data from that drive!).
Have you considered using a cd-writer instead of a zip drive? backing up files on CD-R or CD-RW has several advantages. The price of the media is only a fraction of a zip cartridge, a CD can hold up to 700MB of data, the writer can also be used by the musicians to burn their latest projects, CD's are platform interchangable (any CD-R can read the CD).

>I could use some information on how to set up a zip drive with an ST as
>I've never used one myself.
Dr.Uwe Seimet has answered this already :-)
Setting up a cd-writer is very easy, you'll need the LINK and a dedicated software package, for musicians I recommend SoundPools CD Recorder Pro...

Cheers from Belgium
Dennis

Good day all. We are currently seeking a reliable source that can reference for us as to who actually owns the rights to the Atari TOS. We have tried to contact Milan with no avail, and we are wondering if anyone in this UseNet group may have accurate information on this matter.

We are interested in making Atari TOS available on our Torro multimedia system series that will be debuting this fall, and we would need to negotiate with the actual owners of the operating system. If anyone has information on this matter, please e-mail, write, or call Merlancia Industries at:

A wise decision. CVS is one of the best programming tools I know. I would not want to develop anything without it. I also use it for HDDRIVER.

As far as I know WB systemtechnik still sells the LINK96. I have not
heard any complains about them.

I suggest you ask WB Systemtechnik for details on this.

On Sun, 8 Jul 2001, Dennis Vermeire wrote:

> What on earth is CVS ? :-/

Concurrent Version management system. It is mainly meant to allow several people to simlutaneously work on the same sources. Basic instructions are found on the SapreMiNT page.

> >Recent betas indicate an indecent minimal memory requirement that

The current main developers do not care. They all have a Milan with tons of memory or something similarly loaded with features. In their opinion, so what if end-users can no longer compile a kernel within 10mb of free ram, the changes they made are better for the kernel and library; user-hostileness is irrelevant, when achieving a certain technical feature is the goal.

That's why I'm no longer using my TT. Even though I know how to access SpareMinT's CVS tree and to compile my own kernel, the current kernel betas seem to use more and more memory, to the point that my 26mb TT no longer can compile a kernel, unless I unload _everything_ including the AES. This previously wasn't needed but, as I said, the main developpers have repeatedly shown that implementing a feature is more important to them than making sure MiNT is still usable at least on a TT and Falcon (maybe not on an ST anymore, but this is OK).

Recently, I joked that maybe the platform should now be called m68k-milan-mint and it looks like this is exactly what they are making it into. Too bad.

Uwe Seimet is correct that Atari no longer has sufficient developpers and commited purchasers to make it worth producing anything new. Looking at the situation with MiNT and with Atari dealers all cheating their customers one after another, should this be surprising?

Uwe, you didn't understand me.

MiNT maintainers are not gonna produce further releases of the
kernel and XDD/XFS.  They expect ordinary users to either give up
on the latest MiNT developments or learn to use CVS and compile
their own kernel from the current CVS tree.

I agree, CVS is a very good tool _for_developpers_ but expecting
end-users to _have_ to learn how to use it just to get access to
the current versions of anything is very wrong.

You mean there won't be any binary kernel distribution anymore? If this
is true it will be the death of MiNT as far as the ordinary user is
concerned, indeed. On the other hand, most ordinary users are probably
using MagiC anyway :-).
Note, however, that ordinary users, as you call them, will not do any
MiNT development at all. Someone developing software is not an ordinary
user anymore and it is fine to expect him to learn using CVS.

Look at the 1.15.10b release for an idea of where they're
heading: one _huge_ archive containing _everything_ instead of
individual releases of the kernel, mint-net and filesystems.

> If this is true it will be the death of MiNT as far as the

Correct, on both accounts.

On the other hand, Magic is also a dying platform that has yet to
deliver the improved networking stack that was mentioned a couple
of times on Bengy's site (with Ethernet, DHCP and ISDN support).

> Note, however, that ordinary users, as you call them, will not do any
> MiNT development at all. Someone developing software is not an ordinary
> user anymore and it is fine to expect him to learn using CVS.

Precisely why most people are currently looking for alternatives
to MiNT, since they are not interrested in developing anything;
they are average end-users who need a good multitasking AES and
expanded networking possibilities that support cable-net and/or
home-ISDN being offered to them in their area. Nothing else.

Myself, having heard from Mille Babic that the Magic port of
MiNT-Net has now reached a stable point, I'm considering very
seriously a platform switch to Magic. Otherwise, if that turns
out not to work so well, I predict that my TT will slowly gather
dust besides my everyday low-end Linux PC workstations.

TOS was owned by Atari, and I guess that Hasbro bought the rights with the rest of Atari.

Several companies have bought (differing) licences from Atari, including Milan.

So I guess if you need a license, you will have to talk to Hasbro. If you want to get Milan (or some other licensee) to make a TOS version for you, that should be possible, but I don't think they could give you source-code.

I think I have to put my question more clearly: Do you just *think* that there will not be any binary distributions anymore or was there some kind of official decision? If there was I would expect it to be published somewere for everybody to read. Otherwise this would be just your personal opinion, but not something that could be sold as a fact.

> On the other hand, Magic is also a dying platform that has yet to

Some web sites, in particular those for the Atari, promise a lot of what will never be delivered. You cannot expect further development of

commercial programs when there are not enough users left to finance this
or pay for the software. What will remain is software from those who
earn their living but other means than selling commercial software for
the Atari, but just write/sell software for the Atari in their spare
time.

Looks like STonX could be an alternative, provided somebody spent some
time on it. In my opinion the only chance for at least some improvements
is taking an already existing emulation, where the host operating system
already provides all that's needed.

Below is straight from the ICD documentation, though I did not do it this way. One way I got around this is by having an external SCSI case (with nothing in it) and connect a wire from the +5V power supply to the corresponding internal pin (which connects to pin 25 on the Male DB-25P through some cabling). The connector in the SCSI case is a 50pin header, which in turn connects to a 50pin centronics connector, which I connect to a centronics-to-25pin-SCSI cable then to the zip drive. I believe the pin I jumper was somewhere near the middle of the 50pin internal connector.

That was the first way I got this to work. Now I have a SCSI CDROM occupying that external SCSI case. It powers the TERMPWR pin. So, if you have a SCSI CDROM drive, connect it to your atari first, then connect the zip drive to it and the zip drive will work fine once all termination is done correctly.

___BEGIN ICD DOC___
How to get power for your Zip drive:

Make a cable that goes from your unused joystick port to the unused port on the back of the Zip drive as follows:

```
   Female DB-9S  pin 7 <------------> pin 25  Male DB-25P  (5 volts)
                 pin 8 <------------> pin 24               (ground)
```

The decision not to release further individual binary packages
was mentioned on the MiNT list, when the 1.15.10b archives were
released as one huge bundle, to a lot of people's surprise.

AFAIK, there wasn't any postings about this subject.

Frank Naumann also said there was no such posting. Actually, I think you
and Frank are much more reliable than Martin-�ric. This would not the
first time Martin-�ric was telling fairy tales ...

M-E is partially right. It wasn't posted on the MiNT-list, but it's mentioned in one of the readme's either in the 1.15.10-release or on Frank N's web-site. I'm not sure if this applies to actual releases though, or only betas and sources.

What follows is a part of the readme of 1.15.10 archive:

===================quote===================
This is a beta version with important bugfixes compared to the official
FreeMiNT 1.15.9 beta release. Please refer to the ChangeLog for a detailed
list of all changes.

Attention
=========

From the last beta release until now many things have happened. We now
use the CVS version control system for source integrity and source
management. That's why several things are now handled in a new way.

First of all, most of the kernel modules are now part of the CVS
tree and no longer maintained seperately. There will be no seperate
releases of those modules in the future.

The same also applies to FreeMiNT related tools that are part of the CVS
tree.
===================unquote===================

Up to you to make a conclusion.

TTFN
Martin

Nor do I recall such a post. You make it out as if a binary is impossible to get a hold of. I see people on IRC sending binaries to each other very often. Now if you wish to have special compile time options set, maybe it is a problem for you. Normal users are not interested in such things though.

did some of the st's use the inferior 1 bit chips like the amiga?
my 520st had 4bit chips, so I just took 4 more off an old video card from a PC and soldered them onto the blank positions allocated fro them and got 4 more capacitors too.. works like a charm

"Hallvard Tangeraas" <x@x.xx> wrote in message news:1exc1ug.2pxczqqxahrcN%x@x.xx...

you can always adjust the horizontal width, its usually by a huge potentiometer with a large plastic handle inside the monitor around the same region as the line output transformer..

it is adjustable, but usually not by much

IIRC most 520 and 1040 STs and STFs used 41256 RAMS, which are
256 kbit * 1bit chips, and MEGA STs used 411000 : 1024k*1

1-bit chips weren't "inferior". In some cases, it was preferable to use
"narrower" RAMs.
Just like today not all DRAMs are 32-bit...

Since ST's "MMU" chip can work with up to two banks, each being 64 Kb, 256
Kb or 1024 Kb, it seems that ideal RAM for it would be 1Mx16, but these were
rare beasts, so next best thing is to use 1Mx1 (16 pieces per bank) if one
insists on using chips, not SIMM modules. Overall, I think it is the easiest
solution by far to use one 4Mb SIMM with 72 pins, like ones from advanced
486 boards and Pentiums (up to some 300MHz, after that they have stard using
SDRAMs instead)...

Regards,

Branko

I have a 40MB supra drive already connected to my Mega4, can I just plug a
SCSI zip into the other SCSI port on the supra drive?

Thanks,

Eric.

Hiya

Yep you should be fine!!! I have tried an ez drive and other things
using something similar.

But if the drive is part of a SCSI chain you will need to terminate it:)

I can't visualise which drive that one is, but there are hard drives
around that have a scsi drive inside with dma through AND SCSI through
as well!

Hi people

After a long time, i've managed to get hold of a 130xe and floppy
drive:)))) Which i've been waiting for to try and support the 8-bit's
again.

Yes i know i'm a glutton for punishment!!!!!!

What i could do with now is a monitor, ideally Atari!

If you have one and are in the UK please let me know:)

```

You wouldn't find a width control being done by a large pot as you described
as there is high frequency current about, very nasty stuff.
Width controls are usually coil/inductor combinations. Width circuits that
use pots would use small pots and other electronics.

The potentiometer you describe would usually do the job of vertical shift.

Atari never manufactured monitors for their Home Computer line.

Would have been a nice addition to their catalog to have a
color-matched video monitor, but those things were probably too
expensive in those days to sell to Atari's intended audience.

I was at the Chicago "Consumer Electronics Show" when Atari introduced
the 130XE model, but I can't remember what kind of monitors they were
using in the displays.   (That was the era they would have brought out
a monitor for the 8-bit if they were ever going to do it, but nothing
ever showed up in their product line.)

Atari was too busy introducing the 260ST and 520ST at that show to
spend much time on the 8-bit computers.  People would walk up to the
130XE,  look at it for a second, realize it wasn't the ST, and turn
right around, heading for the other side of the room,

I wonder if any "prototype" monitors might exist somewhere though...

I have seen shots of what appears to be an SC1224, but with the red atari logo. They were shown in Explorer in the mid eighties, during the 130XE release. As far as I know they were never put into production.

I would rather suggest buying a VGA801 (www.matco.com IIRC) or a
similar device which should enable you to connect the XE to a modern
multisync monitor. That's how I use the same monitor for my XL and
my Falcon.

Gerhard

Why not? I had a 1040 STFm with 41256 RAMs and currently I have a MegaST
with 4C1024 RAMs which are functionally equivalent to 411000...
In fact, I think that Ataris with 4-bit wide RAMs were in minority.

>Since ST's "MMU" chip can work with up to two banks, each being 64 Kb, 256
>Kb or 1024 Kb,

In fact the sizes were 128, 512 and 1024KB per bank. AFAIK each subsequent size is one bit wider regarding the multiplexed address (i.e. 2x2=4x larger size).

By the way, any idea what did the "reserved" settings in the MMU configuration registers (for memory bank size) stand for? Extrapoloating the specified settings (00=128kB, 01=512kB, 10=1024kB, ...11=?) it would appear that "reserved" would stand for 4096KB banks... Would this setting have any effect, considering that required in-chip circuits are probably nonexistent?

>it seems that ideal RAM for it would be 1Mx16,

Indeed, alghough this would complicate somewhat byte-access; among other things, those latches which stand between RAM and the main memory bus would have to be designed differently.

>(up to some 300MHz, after that they have stard using SDRAMs instead)...

What are the consequences of this?

I doubt that it would achieve anything usefull since there is no multiplexed
A10 pin for DRAM (only A0 to A9...)

> >it seems that ideal RAM for it would be 1Mx16,

IIRC those things have separate CAS for each byte lane, so it would be
useable directly, without any glue logic. Each of two chips would be
connected as one bank...

>
> >(up to some 300MHz, after that they have stard using SDRAMs instead)...

Well, you can't use SDRAM directly, although it wouldn't be bad masturbation
DIY project ;o))))

Oh, they are, as far, as I know. (I like commas ;-) And you can
connect to a linux device through the emulator from within MiNT.
Ok, the setup is not so easy. But if you want to try it?!?

Yes, indeed it has a very fast m68k core in the emulation. There are
just a few (assemblercoded and UAE), which are faster.

Yes, you are right. The most important thing is, that things are going

on, and that there are new developments. People need to have fun!

> again.

I wish i'd known, ive got a 320K 130 XE and a 256K 800XL that i want to get
some money back on, also 2 Happy 1050's and a straight 1050. 850 interface
also here.

What you really need to do is to get a video converter and a Commodore monitor cable. Then you will be able to hook up the 8-bit to any VGA monitor. Works great for me.

Vintage Computer Festival 5.0
September 15th and 16th, 2001
Parkside Hall - San Jose Convention Center
San Jose, California
http://www.vintage.org/2001/main/

Mark your calendar! The fifth annual Vintage Computer Festival is scheduled for the weekend of September 15th and 16th at Parkside Hall in San Jose, California.

The Vintage Computer Festival is a celebration of computers and their history. The event features speakers, a vintage computer exhibition, and a vintage computer marketplace. We showcase all different types of computers for all differents kinds of platforms in all different shapes and sizes.

EXHIBIT YOUR VINTAGE COMPUTER

Vintage Computer Collectors: we want you! Exhibit your favorite computer in the Vintage Computer Exhibition. First, Second and Third place prizes will be awarded in 13 categories, including the coveted Best of Show.

For complete details on the VCF 5.0 Exhibition, visit:

http://www.vintage.org/2001/main/exhibit.php

BUY/SELL/TRADE AT THE VINTAGE COMPUTER MARKETPLACE

Do you have some vintage computer items you'd like to sell? Whether you rent a booth or sell on consignment, the Vintage Computer Festival Marketplace is the premier venue for selling old computers and related items. If you would like to rent a booth or inquire about consignment rates, please send e-mail to <vendor@vintage.org> for more information or visit:

http://www.vintage.org/2001/main/vendor.php

TELL A FRIEND! TELL A FRIEND! TELL A FRIEND!

We really hope to see you at the VCF 5.0! And remember, tell your friends!!

A printable flyer in Word format can be downloaded here:

http://www.vintage.org/2001/main/vcf50.doc

I think this coul be done with a simple PIC12C508.
I am busy righ now, but willing to write that code snippet if someone wants to try it out.
I think waht PIC should be able to do is to watch STEP and DIR lines from the machine, and then repeat them to the floppy, using right 3 ms timing.
With 16MHz on FDC and twice as fast steps from the machine side this means that chip would have to have some bookkeping to do. For example, at masimal step speed, machine would step at 1.5 ms and floppy can manage only 3 ms.
So, when stepping from track 0 to track 79, floppy head would reach track 39 by the time machine issues last step. For majority of operations (if not all) this bares no significance, except that sometimes extra spin will be needed as head will not be initially on the right place...

Physically, PIC is in small 8 pin pack and can work without externall components (like crystal or reset circ), so it wouldn't greatly complicated

things...
It is also as cheap, although eraseable ones can cost 30DM...

Regards,

Branko

Wow. That was fast ! Thanks.

Thing looks more or less what I have done. I've done several versions of GALs in the past, tailored every time to actual needs, but in essence because I forgot where did I showed that little file ;o)

he did the effort of detecting HD on all drives, which I never needed, but I found that ability to set active state of floppy's HD signal useful more than once, which is absent here...
Usually, one can cram into same GAL also some other thingies, like 16 MHz CPU hack and overscan.

But step rate correction is unlikely to fit into GAL. Microcontroller is much better solution for that, and PIC12C508 seems perfect fit, since it is 40% smaller than even GAL16V8 !

Regards,

Branko

No, I mean, sometimes one has to rsort to soldering when extracting HD
signal from the drive. Not all drives has it on the connector and it has to
be taken from HD switch, for example. Sometimes internal HD signal from
switch is of oposite polarity and this is when polarity select comes handy.

Off course, when one can roll his own GAL from equations, it is easy to
change equations accordingly...

PICs, especially small ones, like 12C508 are as expensive (and as abundant) as common household dirt. ;o) I use them as "smart bullets" for solving daily problems.
For example, I have shoot one of these into my logitech mouse for hardware doubleclick- so I don't need driver for this ;o)
Special equipment is needed, but free programmers can be built by the various
plans on the web. Just do a search on PIC programmer. Majority of them are for PIC16F84, but when one comes to think about it, it may be better for the job than 12C508, since it is FLASH based and costs about the same as 12C508...

> How come nobody's made a realtime battery-backed clock for the ST?

There was a project that utilised a PC clock module that piggy backed with a
ROM chip, istr its no. being DPS 1206???? or similar.
Derryck croker (derryck@08002go.com)investigated this a short while back,
having succesfully tracked down a document with details. However, the chip
concerned is quite old and when made had an internal battery life of 10
years, which has just about expired!!.

Sounds like one more thing that could be killed with "PIC-bullet"...

PIC could be placed between ACIA 6850 and keyboard, which would constantly
lurk on the link and update its internal time when ordered to do so by
system. After reset, it could copy its internal timers to HD6803...

Off course, PIC would have to battery backed, but that shouldn�t be a
problem, given their low power consumtion...

Regards,

Branko

I have had some corruption on one of my HD partitions.
Diamond Edge seems to have cleaned up the lost clusters
but there are a few folders that I am unable to delete
or rename because of a TOS-33 error. Edge says everything
is ok but it clearly isn't.

I tried HP Optimizer but it reports an error due to the
number of clusters on this partition and it doesn't
attempt to fix the problem.

Its just a 500Mb TOS partition but if I cannot fix it then
I will just have to copy everything onto my other partitions
and zero the D: partition.

Any better suggestions ?

Regards,

Peter

The 260ST was Atari's first model in the ST line.

At the time, memory was EXTREMELY expensive, and they wanted to keep the cost of their new computer line as low as possible, so the first one was going to have 256K of RAM in it.

(Atari liked to "round up" the amount of RAM into the model number. Thus the 512K Atari 520ST, and the 1024K Atari 1040ST.)

Anyway, by the time they actually introduced the ST computer line, they had realized that 256K simply wasn't going to be enough RAM to do anything useful, and dropped the idea. The first model introduced in the US was the 520ST.

Actually, they DID sell a few 260STs in Europe, probably just to get rid of the ones they'd started to make. Those would probably be "collectors" items if you could find one today!

A somewhat funny thing about the 260ST is that when the ST line was introduced, the Operating System, TOS, wasn't ready to be released yet, so there were no TOS ROMs available to be installed in those first computers.

You had to load the version of TOS they did have from a floppy disk, which meant it was loaded into the system RAM.

The poor little 260ST I saw at the Consumer Electronics Show in Chicago didn't have enough memory to do ANYTHING after TOS had been loaded from the floppy.   They were using the 520ST to do all the demos.

Just a dusty footnote in the lost archives of Atari history...

Hi Roland,

I don't know about that perticular host adaptor but it should work. Use a search engine to find "anodyne software" its a company run by a dude who did extendos which is the cd-rom driver software I use for the cd-roms on my ST.

I think it was Sam Tramiels idea from when he was at Commodore that
```

model numbers match memory size. The 400 and 800 from 1979 originally had 4k and 8k RAM in 1979, but they'd grown somewhat, so that the name didn't identify RAM size when Mr Tramiel took over in 1984.

An 8 bit machine with 64k (65536 bytes) was a 65XE
An 8 bit machine with 128k (131072 bytes) was a 130XE.

(There may have been a smaller 8-bit in the XE range, but I cannot recall seeing one in 1985/1986)

The ST was supposed to start with 128k RAM as well, and so would be called a 130ST (131072 bytes = 128k), and went up from there: 260ST (262144 = 256k), 520ST (524288 = 512k) and 1040ST (1048576 = 1024k = 1M)

But, as you say, the fact that the OS consumed so much RAM meant that the 130ST was killed before birth, and the 260ST was abandoned.

As you can see, the model numbers doubled as the memory size doubled.

> Anyway, by the time they actually introduced the ST computer line, they had realized that 256K simply wasn't going to be enough RAM to do anything useful, and dropped the idea. The first model introduced in the US was the 520ST.
>
> Actually, they DID sell a few 260STs in Europe, probably just to get rid of the ones they'd started to make. Those would probably be "collectors" items if you could find one today!
>
> A somewhat funny thing about the 260ST is that when the ST line was introduced, the Operating System, TOS, wasn't ready to be released yet, so there were no TOS ROMs available to be installed in those first computers.

>
>There was a project that utilised a PC clock module that piggy backed with a
>ROM chip, istr its no. being DPS 1206???? or similar.

Didn't work for me, I suspect that Dallas Semiconductors sent me the wrong
variant of the chip. Couldn't complain as it was a free sample. Also this mod
isn't really suitable for those STs where the PSU is over the TOS chips as
```

there is a head-room problem :-(

But anyway, plans and the necessary programs should still be available on the 'net (Vazz' hardware mods site might prove interesting).

>having succesfully tracked down a document with details. However, the chip
>concerned is quite old and when made had an internal battery life of 10
>years, which has just about expired!!.

I'm pleased that the NVRAM in my Falcon is still being refreshed by its battery, that can't last much longer :-(

Back to the clock, I think that there was a Y2K issue as well - but it was all such a long time ago!

Nice idea, you'd also need a timekeeper for the PIC, Dallas make the DS1302
which will output time and date.

No, you wouldn't, that is the best about this idea. PIC could do timekeeping
perfectly by itself. It has all needed hardware within the chip....

To get back on topic, yes there was one found.

Atari had made a composite video monitor for the 8bit line of computers.

I was with John Hardie in 1994 when we visited San Jose Computer's (went out business a long time ago). San Jose Computers was in the Atari business in the Valley for sometime along with B&C and Best.

John found there a prototype of a 8bit computer monitor. Didn't know if it worked or not. But he bought it for, if I remember right, $20.

At the time, John was buying so much stuff that he didn't have the money to ship it back. So he asked Mike Hohman of Fine Tooned Engineering (fTE) to ship it back. Well that never happen. Mike put it in storage and later disappeared.

News later is that the storage unit that Mike had was opened up by the owner and all the property sold off. Another 8bit collector had purchased the monitor (found this out at World of Atari '98 show). There were a lot of people who lost their stuff in that property sale.

So yes, an Atari made 8bit composite video monitor does exist and is now in a collectors collection.

And now you know the rest of the story...

Hallo Peter!

PS>Any better suggestions ?

go for a sector editor like diskus (commercial) or SED (freeware), enter the
appropriate directory sector, and replace the first letter of the
"non-deletable" directory entries with $E5. The entries will be deleted then,
but there will be lots of lost clusters. Any of your optimizing programs will
recover those, though.

with best regards
Ekkehard

The whole circuit including step-rate correction and HD switch for two drives (including step-rate correction for 40-track 5.25" drives!) fits into a 16v8 fine, provided you add an external monoflop which is set to a bit below 3ms.

The circuit I built long ago consists of a 16MHz can-type crystal oscillator, a 16v8 and a 74LS221, all on a neat, small PCB.

That should be the normal behaviour for any decent HD mod. It means that you
have to wire up the DS lines to the GAL, but that is not too much effort
after all.

Nice one. You probably filled that GAL to the guts ;o)
Could you enlighten us, why the "external monoflop is set to a bit below
3ms" ?
So that you could use 5-bit counter instead of 6 for pulse counting ? ;o)
If that is what you have done, are you sure it would work on all floppy
units ?

If I can, I keep things digital. Much more reliable, repeatable, robust, and
you don't need quality scope for troubleshooting...
For example, one 12C508 is smaller than LS221 and would live without any
external component, but at cost of roughly 1 DEM a piece is somewhat more
expensive, and of course, it is not reprogrammable within that budget ;o)

Branko

I have just bought a second-hand HP DAT (SCSI) for 20 UKP. What do I need to use it with an Atari? I've heard of GEMAR - where can I get it from? And are there any other drivers for this?

Many years ago I bought a RTC for my STFM using a chip and a connector that plugged into the keyboard processor; this used

rechargeable penlites in a holder taped to the shielding with
double-sided tape. Made by a firm beginning with 'M' (?Michtron?)
in Cornwall, ISTR.

Not really. There were designs where I had to squeeze in a lot more.

>Could you enlighten us, why the "external monoflop is set to a bit below

The monoflop is triggered by the STEP signal, and while it it active, the
FDC clock is switched down to 8MHz so that the step rate is correct.

If the MF has a time longer than 3ms, the FDC will finish the step and probably start reading/writing when the clock is still at 8MHz. By setting the time to a bit below 3ms, I can be sure that this can not happen.

Using a pot for the time, it is easy to adjust: run a seek test and adjust so that the seek speed is a bit higher than on DD disks.

>If I can, I keep things digital. Much more reliable, repeatable, robust, and

And you have to program one more part - you can't switch 16MHz signals with a PIC, so you would need an external multiplexer and divider.

I tend to use standard parts as long as they are available and suitable for the job.

This is sad news, and not unexpected. Although I half hoped that someone will dispute it...

Well, the "maintainers" have finally achieved their goal- they have suceeded to shut us all out of their perfect world, so that they can admire their artwork undisturbed (see how elegantly this memory protection is implemented... too bad there is nothing left to protect...). Mint maintainers and advocates headed for a long time into this direction where technical virtuosity is an end to itself, and those who couldn't care less about the entrails of an OS and just wanted an usable system were implicitly declared to be ignorant morons.

This looks like a betrayal of the spirit of Atari, which was known for small and efficient OS and applications. If one has to switch to a machine in the 100MHz/100MB range, then, frankly, there are better operating systems to run than Mint. And, on the other hand, Mint's competitor- Magic, which offers similar features (with inner differences which are important only to freaks) still operates successfully on a ST with a couple of megabytes of memory.

Also, what kind of monstrosity is this development system which needs about 30MB of memory to compile a 200KB program and some appendices? Very complex applications were happily built on machines with smaller resources. This looks as bad as Wintel. "C" was supposed to be a "small" language with a simple compiler which was to be able to run practically anywhere.

Maybe we should just note which was the latest usable version of Mint and use it as other Atari legacy software is used.

So, to paraphrase what some of them used to say, Mint Is Now History...

Let's move on, shall we?

cu.

I think he is confusing RPM packages with MiNT itself, the same way he is
confusing running MiNT with compiling MiNT.

A lttle over dramaitic. You do know that you can switch off
the memory protection?

Contrary to Martin's stereo-type of elite users with fast big
machines, I have never compiled a kernal on my Hades. Never.
I don't know my way around gcc or how to even set compile time
options. I also don't particularly like to be stereo-typed
in such a manner, it took ages to get a Hades, determination
and alot of work. These things are not given to you.
If he cannot afford to move up, don't blame those who have
the will power to do so. Use an old MiNT kernal for your
old machine, that option is always there...

So he is not right at all. The talk was about the mailing list and about
releases. I definitely referred to official releases at the beginning of
this thread.

Yep and I clearly recall asking on the MiNT list about this, only
to be told that, once again, this is for the best - nobody ever
addressed my point that average people don't need/want CVS.

We discussed _current_ versions, while your post was about MiNT
not being actively developped anymore.

The README mentionned by someone else (which, as I recall, is in
Frank's older release dir) is also sufficiently clear about
intents regarding further releases. Draw your own conclusions.

So all this says is there will be no *separate* releases. It does not say
that there will be no binary releases. It only means that you only have to
pick up one single binary archive instead of many separate ones.

If they are, then show us the posting in the MiNT mailing list you were
referring to. If you cannot do this it is obvious that you were not
telling the truth.

This is easy. You were talking about a posting in the MiNT list. This
posting does not exist. And you said that there won't be binary
```

distributions anymore. Nobody ever said so except you and there is also
no text document saying so.
So the only possible conclusion is that you were not telling the truth.

```

I have neither the time, nor the inclination to look thru all
those older posts. It's all the same to me what you, or anyone
else, will decide to call me as a result. If _you_ want proofs
then _you_ search thru those posts. Period.

I do not have to prove anything because I did not claim anything wrong.
But for all those reading this thread it became more than clear that the
contents of your postings are wrong and you don't even care about
telling the truth. Just reading this thread is sufficient to realise
your attitude. Atari users are not as dumb as you think they are.

Often the people writing such a nonsense are those not contributing
anything at all to keep a platform alive. They are just complaining and
besides that are not willing to do anything useful.

Nice to know that you are still contributing to the nonsense and
doing so much to keep the platform alive. I'll remember that.

You seem to be as well received here as you were on the MiNT list.
There's a trend... the nonesense follows right behind you.
Congrats on consistancy.

Thank you. Nothing surprising in either cases: jerries who prefer to waste my time arguing and calling me a liar over _where_ I might have read something instead of admiting that _what_ I have read indeed says what it does, just like the MiNT list was champ at arguing over proper terminology instead of admiting that they recoded something in ways that hampers the end-user experience and limits further usefullness. Typical penguins quoting RFC's and being picky on the source, as a diversion for having to admit anything. Uwe himself is not immune to nonesense (see his recent statements about the Stacy's SCSI park implementation using "dirty" tricks), but he prefers to hold on to scapegoats instead of admiting this.

I had no problems admitting that I was wrong. You obviously have. And
makes quite a difference whether you are just mistaken or whether you
deliberately tell something wrong. That's what you did, even after I
asked you whether your claims where your personal opinion or facts. You
said these were facts posted in the MiNT list but it turned out for
everybody to see that this was not true.

Hi,

I've dusted off the old STe and as a hobby project I'm bringing it
back into shape. I still had quite a bit of software on the HD but
I've lost most of the floppies that I had.

So I'm looking for someplace to download warez, things like Harlekin,
That's Write, stuff like that. It wouldn't even be /too/ illicit since
I have paid for these packages some time in the past ;-)

Also I'm wondering if there is any proprietary Atari software
available somewhere. For instance, I still have GDOS 1.1, which is
just as well as I haven't seen it on any sites. But I can't imagine
it's impossible to find...

Regards,
JM

Nobody has proven that these facts were NOT mentioned, any more that I have bothered to prove that they indeed were. Period.

Nobody has to prove anything except you. Nobody except you deliberately
made false claims.

The post below very clearly said what I claimed, and the README
released along with 1.15.10b supports it. You can put earplugs

in your ears and argue about _where_ I have found the info all
you want, the truth is still clear.

Anyhow, I'm through wasting time with people who would rather
beleive in their own hype, than admit that a README coupled with
over one year of CVS-only releases is not a clear enough message
about what the future of MiNT is, especially not with someone who
starts by claiming that there is no longer any MiNT development
despite evidences of the contrary.

Point final.

Newsgroups: comp.sys.atari.st.tech
Subject: Re: Magic OS

The decision not to release further individual binary packages
was mentioned when the 1.15.10b archives were released as one
huge bundle.

Date: Mon, 09 Jul 2001 19:50:54 GMT
From: Martin "Nightowl" Byttebier <tos4ever@pandora.be>
Newsgroups: comp.sys.atari.st.tech
Subject: Re: Magic OS

What follows is a part of the readme of 1.15.10 archive:

===================quote===================
First of all, most of the kernel modules are now part of the CVS
tree and no longer maintained seperately. There will be no
seperate releases of those modules in the future.

The same also applies to FreeMiNT related tools that are part of
the CVS tree.
===================unquote===================

Indeed, I was a little over dramatic, for emphasis :)
Anyway, it appears that initial M.E's statement which started the thread
is dubious, so things may not be as bad as I portrayed them.

>You do know that you can switch off the memory protection?

Yes, I know.

>If he cannot afford to move up, don't blame those who have
>the will power to do so.

Yet he has a point, to a degree, saying that Mint should be able to
run comfortably at least on standard TTs and Falcons.

Why not take your "know it all approach" and diff the kernals
and put the old memory-alloc.c back to it's previous condition?
That should be easy enough. Had it occured to you that if you
temporarily install an older kernal you could compile a newer
one?

Hi!

Martin-�ric Racine <q-funk@funkyware.atari.org> wrote:
> The post below very clearly said what I claimed, and the README
> released along with 1.15.10b supports it.

You claimed (see
<Pine.LNX.4.21.0107071432010.10818-100000@hal.pp.fishpool.fi>):

> [...] maintainers of the kernel and programming library insist one
> _must_ use CVS to access newer releases. They have turned MiNT into a
> geek-only toy, without any further release using normal tarballs
> packages. Granted that CVS is not that difficult to use, but is
> nonetheless a serious breach of the user-friendliness Atari was known
> for.

And the post/mail you quote for "evidence" says:

> The decision not to release further individual binary packages
> was mentioned when the 1.15.10b archives were released as one
> huge bundle.

The README says:

> First of all, most of the kernel modules are now part of the CVS
> tree and no longer maintained seperately. There will be no
> seperate releases of those modules in the future.

> The same also applies to FreeMiNT related tools that are part of

> the CVS tree.

For me (and I'm sure others will agree), both quotes simply state that a
lot of modules (.xdd, .xfs, etc.) that were distributed as separate
packages will be part of one large distribution, i.e. no longer
distributed as ext2-*.tar.gz, etc.

They neither say that CVS will be the only way to get hold of the kernel
and its modules in the future, nor do they say that there won't be any
further tarball distributions.

What is true, though, is that it's already been quite a long time since
the last official kernel release.

Ciao

Thomas

Actually everybody except Martin-�ric agrees, as we have already seen.
And he will never agree. His postings made clear that this is one of his
character traits.

Uwe

Hi Jean-marie

> It wouldn't even be /too/ illicit since I have paid for these packages some time
>in the past ;-)

I owned a watch once, so is it alright if i break into your house and take yours.

If youve sold your car, is it alright to help yourself to one from a dealer, "because youve paid for one in the past".

There's an interesting thread elswhere that wants people to pledge funds for a new browser, tell them you'l just steal it when its finished anyway and see what reception you get.!.

Hey guys, Jean-marie wants to steal some software, could you upload some of yours!!.

Hi Ya'l,

Well following recent rumours of the demise of Magic the operating system, it seems
that rsn(atari), we are to expect an update to a version 6.2. Details are to be found at magic online, http://www.magical-sides.de

Its probably dead after that, but its also probably evolved as far as its able to, so what the hell!!.

.

Ever had looked at stonx.sourceforge.net? You can get the newest
developements out from the CVS.

Yes, but I don't see much of a change. Only 7 minor changes since about
half a year.

Hmmm... what would you like to see? I would say, that using your Linux
filesystem directly from MiNT or using a Linux-Console for MiNT are
good news, right? But you are right. Mostly they did make the emulator
more stable. In the moment Alex is in progress to implement an opcode
level debugger in STonX. So you can sse, how your programs work fro
mthe outside. ;-)

Martin

Martin Doering wrote:

> Hmmm... what would you like to see? I would say, that using your Linux

I would like to see the usual things you expect from an emulation: To get more compatible with the emulated system. Keyboard overruns, for example, have already been a problem with SToNX years ago. I don't think the serial ports are still properly supported but I may be wrong.
Anyway, STonX is an interesting project and with today's machines it does not suffer anymore from what made it hardly usable years ago: Lack of speed.
I'm afraid that instead of spending time on software projects like STonX, where more users are able to contribute something compared with expensive hardware emulation projects, time is wasted on waiting for new hardware clones, which are announced again and again, postponed again and again and eventually die anyway.

I am offering to anyone who wants them a fully functional 1040 ST, Color and Mono monitor + all of my software and accys (including a desk cart). All I ask is that you pay for shipping. If you live in New England (Boston area) you can pick them up.

Otherwise, they will be relegated to the dump!

Hi,
I'm using an ICD SCSI adaptor on my Atari.
I've always had just one Seagate 40MB ST-157N drive
on it. I just tried to add a 2.1 GIG IBM Fast-wide SCSI II
drive on the chain, and my ICDboot.prg won't see it on boot
up, just the Seagate (ID#0).
I'm using an ICDboot.prg driver version 5.6.1
from 1992.
Does anyone know if that's the problem.
Do I need a later version that recognizes larger
drives?..or does the ICD just not like IBM drives?
(Its'actually and OEM Quantum drive made for IBM)
Someone mentioned it may be that my IBM drive has
"SCSI Bus Arbitration", whatever that is, and so the
ICD adapter wont see it..

Any ideas
Thanks
Matt

Was the last line really necessary?

What impression does it give?

Is the Atari really fit only for the dump?

A little more respect please!

Barrie at Keychange.

Yeah? Where are these Sparrow docs to? I have chips'n'chips which gives
some details but not much. That would be really good to see them.

Hi Hallvard!

On 6 Jul 2001 14:33:01 G, Hallvard Tangeraas wrote:

>There's also some talk about connecting a wire to a pin of the joystick
>for power. I take it this is the +5V signal needed for SCSI "TERMPRW" at
>some pin of the SCSI unit (pin 11?).

Note that you only need to do this if you are not using another SCSI device. If you use another device in the chain then the drive will work without term power from the joystick port. Also note that this is only on the Zip 100 units, the later Zip 250 units didn't have this problem.

>Anything else to remember? When everything is set up, will it then act
>just like any harddisk?

Mostly, you will notice that it is a lot slower than a regular fixed hard drive. It also has a auto spin down feature which after it spins back up brings in a pause of about a second before accessing data.

>Will such a drive be auto-bootable? Someone who has a zip drive
>connected to his ST tells me that he needs to reboot it after power has
>switched on (warm boot), and some AUTO folder program has to be used.

Thats never happened with my Zip 100, on both my STs and now my Falcon. It's possible it's a problem when used to boot from but I seem to recall it booting fine.

Cheers!

James

Hello,
I have an Atari 1040STf with an ICD scsi adapter and
the ICD software version 5.6.1
I have added an Iomega Zip 100 scsi to it and want
to be able to read the Zip on a PC and on the Atari.
My version of the ICD software doesn't give me the option
of formatting or partitioning for IBM compatability.

Also, after formatting with my ICD software,
when I tried to partition the Zip drive using ICD software,
I got this ERROR MESSAGE:
Drive timeout encountered while attempting to verify
drive: Sense code:$FF

Do you know what software and version I need to fromat
a SCSI ZIP drive to be read on both IBM and Atari?
Any suggestions?

Thankyou
Matthew Walter

You can can configure the time until spin down, can switch this feature
off by software and/or can use other software to control the time in
case the drive spinning down on its own is not desired.

Hi,
my problem is: I've got an Atari 1040ST, but I don't have the ST Language
Disc. Me was told this disc is need to uses the PC.
Can anyone help me pleas??
Thanks
Dirk

You don't need the disk to run your ST. It contains an outdated version of
Omikron Basic.

Greetings,
Matthias

What was "Omikron Basic" like?

All the ST language discs (admittedly either UK or US oriented) I've seen have either had ST Basic (either original or the Metacomco "Enhanced" version), or, if you go far enough back, you'd also get ST Logo.

(BTW: I've added "comp.sys.atari.programmer" to the newsgroup list, as this may also be of some help)

>using.

If it is simply rename the boot program you are using from floppy to
SHDRIVER.SYS and place it in the root directory on drive C:

If this does not work you are not using AHDI.

This will only work if SHDDRIVER.SYS has been installed using HINSTALL on this drive before and if it has not been removed using HINSTALL again afterwards. It's not only SHDRIVER.SYS that enables to Atari to boot from a hard disk drive. There are also flags and code in the root and boot sector that has to be written to the drive. This is what HINSTALL does and what is also done by the installation software of other hard disk drivers.
The only way to correctly install a hard disk driver is to use the installation software for this driver. If somebody really wants to use AHDI as far as I know the complete software can be downloaded somewhere in the Internet.

Hi All,

I am having to reinstall Magic on my ST after my HD went bananas... and now I find my installation disk is corrupted. Only one file is damaged, unfortunately the MAGIC.RAM one which it won't install without. Is there anyone out there who has Magic v5.03 (English) that could send me this file? I'll be forever in your debt.

Thankyou

A CPU is never "doing nothing" - it is always executing code somewhere
(unless it is HALTed, which does not happen on a ST except on severe errors
- you have to press Reset then).
In case of a 68000 (which has no cache), it will thus fetch instructions all
the time.

In the worst case, ie. when you are executing code from "your" memory bank,
the only accesses outside that memory area would be interrupt handlers or OS

calls. Now if the interrupt handlers and OS are also in RAM (eg. Magic
loaded to alternate ram), you will have *no* external accesses to trigger
your refresh.

For a good design, you will have to insert waitstates into the running CPU
access to insert a refresh cycle althoug the CPU is waiting for data.

Hi Dude

>>>I am testing a very troublesome newserver with NEWsie and ASH
>EMAILER.

>>I hope you get too see this as my IP has decided to cut loose
>>newsgroups, very usefull. I'm currently testing a retrofit news
>>provider.

>Err, it's fixed.

I did wonder after seeing your face a few massages back, youve just
saved me an email.

So what happened, did they plug in a new newserver or just pay the last
bill!! :-)

I think i'l stick here now, its reliable so far, except tonight when
eMailer got fed up waiting in the pop3 server queue!!.
```

Ok, that was a figure of speech; I meant a ST just displaying the desktop,
in fact...

>In the worst case, ie. when you are executing code from "your" memory bank,
>the only accesses outside that memory area would be interrupt handlers or OS
>calls.

...this is exactly what was in my mind.

>Now if the interrupt handlers and OS are also in RAM (eg. Magic
>loaded to alternate ram), you will have *no* external accesses to trigger
>your refresh.

I feared something like that, though an OS which -completely- replaced TOS
did not come to my mind... instead, I was just wondering about the frequency
of interrupts handled from ROM or ST RAM.

>For a good design, you will have to insert waitstates into the running CPU
>access to insert a refresh cycle althoug the CPU is waiting for data.

Well, it will not be too difficult to make that modification, but it will
be a pity to spoil the nice PCB design of the board. If it worked as it is,
it could be just assembled and plugged into my machine...

So if I add a circuit which triggers refresh cycle every 2microseconds or so,
delaying a little any data access which happens to occur at that time
(avoiding collisions, of course), it should be ok, don't you think?

Cu

On the Amazon website there are some samples of music in .RA format
I think these are RealMedia files. Aniplayer will not play them but
are there any players that will ? I think that the BBC also use them
for audio and video so it would be a useful tool.

I am not sure how proprietary the format is so it may not be possible
to write a player. I had a quick look at the RealMedia site but I
couldn't find anything useful about the file formats.

Perhaps there is a player for Unix ?

Peter

Hi Peter,

I believe these are Real Audio files.  I haven't tried them on any ST
system yet but there may be something under linux which could have source
code portable to the ST which may do the trick.

Ahh, yes there are adaptors for the user port to RS232.

How's the SIDsethiser coming on?

The only one that plays ra is realplayer AFAIK and using a port from unix will probably be real slow. ra on Aniplayer needs an FPU but I guess this is in your Milans 040.

Starting with version 2.5 Aniplayer will player RA files, but the computer must have a FPU. I cannot play them on my Hades since it only has a piece of software that emulates a FPU.

>
> Ahh, yes there are adaptors for the user port to RS232.

yup, if you are familar with electronics it's not that difficult.

> How's the SIDsethiser coming on?

well, even though i'd like to have it running, i find myself
busy programming either the 1581tool, now a web-adventure,
making some music. besides getting unemployed |:

inbetween i made a pseudo-stereo-SID-board for the C64II in the
same rack as the SIDesizer. however strange enough the filters
work too strong - and as usual when faced with strange problems
i temporarely change the subject (;

i once wrote a little routine that blasted files, or sid-tunes
via a parallel-cable from the ST-printer-port to the user-port
and then saved those to 1541 disk - it wasnt perfect as i did no
bank-switching and used the ROM-routine for saving, but a few
sid tunes where quickly transfered at about >24KB/s (:

Sounds familiar :)  I'm often changing ideas because I never have the
strength to come over soem problems, depends on what it is though.
Without decent scope etc it can be very difficult that someone else could
do in seconds.

What was the problem though with the SIDesizer, hardware related?

I can no longer bare to sequence MIDI using my PII-300Mhz, and shall be returning to the only entirely stable environment I have ever experienced: the Atari STE1040. But having been using my PC for so long I wonder if anyone can help me to find a way of converting the hundreds of Cubase MIDI songs I've made on the PC to STE format. Is this possible or would I have to use an Atari Falcon, which being more recently designed, probably includes this feature. I know very little about the Falcon, so am slightly dubious about its potential to deal with MIDI as well as the STE, especially as it was designed to record audio as well as MIDI and this feature to me signifies the beginning of the downfall of Cubase-MIDI on the PC. Also I've heard it is possible to get multi-input/output-MIDI adapters for the STE, where's a good place to find one with at least 3 seperate ins and outs (in the U.K)

Good choice.

>But having been using my PC for so
>long I wonder if anyone can help me to find a way of converting the
>hundreds of Cubase MIDI songs I've made on the PC to STE format.

Save them to Double Density disks and they'll be read by the STE fine. PC
disks are High Density (1.44Mb as opposed to 720k) so they can't be read
by a standard STE unless a HD module has been fitted.

>Is
>this possible or would I have to use an Atari Falcon, which being more
>recently designed, probably includes this feature.

Yes, it has a HD drive built in.

>I know very little
>about the Falcon, so am slightly dubious about its potential to deal

It runs Cubase and also Cubase Audio which both run fine if it's setup
right. However for Midi the STE is very stable.

>Also I've heard it is
>possible to get multi-input/output-MIDI adapters for the STE, where's

Erm, not sure if Criss Crosskey sells Mario Becrofts adaptor over here.

Spain, 18 June 2001

This is the question:

Machine: Ste with 4MB and operative NMI.

Try following program under MONST (the best, I think):

```
003FFFFA     4678 8240        NOT.W    $FFFF8240.W
003FFFFE     4E73                 RTE.
```

previously at 0000007C=003FFFFA (NMI Autovector)

When I press NMI a BERR takes place and not executes NOT.W $FFFF8240.W .

ANYBODY KNOW WHY!!!!!!!!!!

Only over 4MB machines with NMI or another interrupt available for the user
(Ring of RS232 for example).

(; just thinging of my NEC 3D that went dead some while ago |:
now i'm learning about TV-electronics *hehe*

> What was the problem though with the SIDesizer, hardware related?
thx for asking i need some pushing at times (8

hm, i'm improving and expanding it step by step. as i want to have
all the single bits running instead of putting sth huge together and
learning in the end sth went wrong ...

now it's the interrupt, the LCD takes 40us for a single char to display.
until now i used a delay-loop. i wanted to run it under interrupt to
use the CPU more efficiently. so i made a 1kHz signal like a VBI of a ST.
but the MIDI (in interrupt) now shows occasional errors ...

furthermore i want to reconstruct the memory map. as i defer between
slow periphals, like the SID + CIA at 1MHz and the fast like RAM + ROM.
now having too much ICs kind of exploited my addressing IC (:

inbetween i took my ST apart (on wich i hack the OS) to put an IDE in there.
i had some trouble (signal-reflections i learnt later) and my ST was 3weeks
practically dead. that put me away from the SID as well ...

but now all works nicely again so i actually could go on finishing the OS
... actually (;

Quite neat, I have one. TOS 2.06 is needed though to autoboot with IDE
drives on STs whereas SCSI can autoboot whatever TOS version you have.

But keep in mind that there are host adapter/SCSI drive combinations
where you cannot autoboot. This is in particular the case for drives
that require initiator identification, like some Quantum Fireball
drives, if you don't have a LINK96 or LINK97 adapter.

Benefit of 2.5 inch drive is that it doesn't requires additional power supply.
But you will need adapter/interface in any case, for IDE or SCSI too.

Hey guys,
I recently obtained a SyQuest 44 drive with an ICD host adapter... and my fading memory is causing me problems with getting this thing running :P

Right now, I'm using AHDI, and it can see the drive... however, I'm not sure what drive letter to assign to the drive (I already have a 40 meg drive with C-F partitions, assigning G didn't work), and if there are any additional steps necessary to get this thing working (drivers, config files, etc).

Any help would be greatly appreciated!

Larry

The drives letters are usually assigned in ascending order by the hard
disk driver. The user cannot influence this, at least not with AHDI.
With other drivers, in particular HDDRIVER, the user can assign any
driver letter (even A: or B:) to a partition on a hard disk drive.

Hi,
Can someone point me in the right direction (doc, etc.), or just explain
how to use diskcopy images with the Atari Emulator NoSTalgia?
Essentially, I have a sample editor program for the Atari and all I have
is a mac. I've downloaded the editor and extracted the files (.prg, etc.)
but I'm not sure how to get the emulator to mount (?) the diskcopy image
to then launch the editor.

thanks in advance,

(can you reply directly to "kram@yorku.ca" since I don't get on this list
regularly (okay, never) and might miss the reply if it comes back to the
list)

ken.

Yes, I'm doing the ROM port to ISA ethernet card adaptor withThomas Redelberger.

>you could write me some routines for the OS (;

Hey, I'd love too but I'm hopeless at writing software. I'm learning asm on an commodore SX-64 though cos it's an easy machine to work on and I have asm in a cartridge for it. Once I've picked this up I can move up onto other platforms. I think if you can do asm then you really have a useful skill and it's natural for a hardware guy to do asm rather than C, Basic, Pascal, let alone the rubbish Microsoft churn out.

Should be plug&play, boot the machine and it should appear as 'g'
on it's own. AHDI will stop scanning the scsi bus at the first
ID that timesout. Make sure you have a disk in the drive
as I don't think AHDI will see it correctly otherwise.
If you are gonna use the machine for any serious work it's
worth investing in HD Driver. It's alot more flexible,
can skip ID's and even allows you to boot with an empty drive.

Hi Larry,

this will sound obvious but did you try doing a partition and format over again? also make sure you didn't set it to the same scsi id as any other device on the scsi chain

ah, sound nice. however i decided to use a PC *shame*shame* (;
for all that internet-stuff i found a healthy combination of my
ST for Cubase and PURE C, My F030 for audio-DSP-mastering and the
PC for dumping mega & gigas of data around

> Hey, I'd love too but I'm hopeless at writing software. I'm learning asm

and a system you can "screw" in any direction for the sake of learning !

however to me the jump from 8 bit to 32 of the 68K was quite a purser.
no little-endian LO/HIs anymore. opcodes of over 8byte ...

> onto other platforms. I think if you can do asm then you really have a
> useful skill and it's natural for a hardware guy to do asm rather than C,

i'd confirm this. i doubt to get my SID anywhere with Visual-Basic,
besides that the 1MB flash-ROM would be too small anyways, well i could

put an 30GB IDE drive in there ... (8

> Good luck!

thx, you've put me back on the road again (;

Hi all,

I'm hoping to find a reasonably priced ST with at least 1 meg of RAM for sale in the US. I only need the CPU unit and mouse. Any 520ST upgraded to 1 meg, 1040ST, Mega ST, etc. would be considered. Please Email me care of drichard@execpc.com with details and price.

Thanks!

Dean

Hi

I've just got hold of a piece of hardware i've been after for yonks...
but the software disk has gone bad during transit.

I haven't got my main STE up and running at the moment, so i won't be
able to try and recover the disk for a while yet.

So if someone has the software on the internet or cang et it to me, i
will be more than grateful:)))) I will be a very happy chappy:))

Well maybe you missunderstand me or maybe I where a bit unclear.I�m not so
god with the English Language.
I dont have the external power supply for my Atari 520ST and I want the
pinouts for the connector on the machine so maybe I can use some other power
supply type Amiga.I have search the Internet for some info but nothing.It
seems that there is very little info on the Atari.Not as for the Amiga.There

```
are many pages with tech. like Shematics.

Thank�s

There are some pages, but the ST with External PSU is quite old and a bit rare. It needs 5v, 12v and -12v IIRC. You could work this all out if you know what your doing by working back from the plug to the main caps and 74 chips take 5v on pins 7 and 14. Take care though and I'm not responsible for damages! 12v and -12v might be used by the RS232 line transievers.

Hans,

My 520ST is from the U.S.A. I don't know if European models were different.
This is from appendix D of the Atari St owners manual.
This view is looking at the connector on the back of the 520ST.
The * is the locating pin at the top of the connector.

```
         *
      6    7
    1        3
      4    5
         2
```

Pin	Voltage
1	+5
2	- not used
3	ground
4	+12
5	-12
6	+5
7	ground

My power supply says:
Output:
 5VDC   3A
+12VDC 0.03A
-12VDC   0.03A

Good luck and have fun.

Ralph

If you are thinking of the 7 pin DIN it goes like this:

1	+5v
2	not connected
3	Ground
4	+12v
5	-12v
6	+5v
7	Ground

I found that the -12v was not required on my model of the 520ST.

hi all
I've just gotten an error message on my Nemesized Falcon.
After the Atari logo comes on there is a message below it saying:
"Bad ROM CRC on chip E"
then 4 bombs, and a freeze.

does anyone have an idea of what this could mean?
and if it is fixable??
thanks for any help
ken

This means that the ROM contents are bad, i. e. the ROM checksum is invalid, most likely because the ROM chip is broken or data are not read correctly from the ROM chip.

> and if it is fixable??

If the ROM chip is broken you have to replace it.

I have just been reading some earlier posts about
this on c.s.a.st and I have posted a suggestion
about the RENaming of devices in the MINT.CNF file.

The other suggestion (not mine) was that the latest
milan serial drivers can cause problems. I too had
problems when I got newer ones from the milan web site
so I reverted to the earlier one that was working
anyway.

1. What versions of Mint and Sting are you using ?
   I have:
     Mint 1.15.5
     Sting 1.26

2. What serial devices appear in the Sting Port Setup cpx ?

I have:
Modem 1
SERIAL2
MODEM2

3. What serial devices are in U:\dev\ ?
I have:
modem1
modem2
serial2

4. What serial device driver version do you have ?
I have:

```
  DRVIN.PRG    1998-09-08  4119bytes
  MFP_MILA.PRG 1998-08-26  5525bytes
  UART2F8.PRG  1998-12-31  4948bytes
  UART3F8.PRG  1998-12-31  4948bytes
```

5. Do these serial drivers load before or after Mint ?

I hope this helps, I am not an expert but my Sting set-up
does work.

Peter

Hi Robert

> AC Input 115 VAC 10% at 60 Hz (fused)

You should remember that this is a world wide group and someone with
little knowledge may take you literaly to their cost.

You should be more specific or your good intentions could turn sour.

Like some other folks (to judge from previous e-mail strings), I
started out with a SyQuest EZ 135 external drive, only to have it

crash and burn after a few years. Wanting to have access to the data
on the 135 cartridges, I invested in the successor model, the 230,
which is backward compatible with 135 cartridges.

I'm having trouble getting my ICD Link 2 properly connected, though.
The 135 drive had a compatible 50-pin SCSI port; the 230, though, has
only a 25 pin port. I've got a 50-to-25 pin converter in between the
Link and the 230, but every time I try to access the drive, I get an
error message on my Atari to the effect that I don't have the ICD host
adaptor installed. All my connections are secure. Is there something
I'm missing?

chances are that it is the programs own format, but try XNview and Infranview both easy to find freeware PC file viewers, both can read and convert around 200 pic formats. Or like u say u have to use the original prg under emulation to convert, there are plenty of free emulators and are easily setup in a few mins

IIRC, the 135 is wired to provide power to the link automatically, whereas on the 230 you had to rig up the wiring to do so. As a quick cheat, if the old 135 still powers up but doesn't read disks, you might be able to just plug it in and add it to the end of the SCSI chain to provide power.

My TT has 32Mb of Sun simms and is running perfectly. #5 each from Acara
(http://www.acara.co.uk/) - ask for 4Mb 30 pin simms for a Sparc 4/300 or
a Sparc 1.

Unfortunately, the old 135 is with us no more.  When it died, it went
to the computer parts graveyard.

But if the 230 isn't getting power...why is the red LED on?

Hi

>But if the 230 isn't getting power...why is the red LED on?

Its not the 230 that isn't getting the power, but the link.  The link has
no power supply and so takes its power from a SCSI device on the bus (230
in your case).  The pin that needs to be connected to 5v is TERPWR.  You
can modify the drive quite easily.

I have a EZFlyer 230 but with a Link97 and that works fine with my
STfm. Not much help to you though. This indicates some difference
between the Link97 and the Link2.

Peter

Hey. I have an old PC floppy drive. Now, it *does* have some jumpers, but I've no idea what ones are what, I am wondering if anyone might have a clue? I'm a programmer, not a hardware man!!! :) :)

OK .. it's a block of 6 pins, in a 2 by 4 block. The top has the letters 'C5' and the bottom 'SP'. Anyone got any ideas? It kinda looks like following:

CN5
OO
OO
OO
OO
SP

There is a jumper connecting the two pins of the third row, and a jumper connecting the first pins on the top two rows on the left side.

I know, I know, this is a huge shot in the dark ;) But before I experiment, I thought I'd see if anyone had any ideas!

Pete.

Youve not mentioned termination or termpwr yet, what have you provided
for these little annoyances.

>> in and add it to the end of the SCSI chain to provide power.

>But if the 230 isn't getting power...why is the red LED on?

The Link relies on a 5V supply on the SCSI bus called TERMPWR to power it.
Although your 230 might well be powered up, there is no guarantee that it
supplies that signal to the bus.

Hence the suggestion that it is not providing power.

When you confirm that the red LED on the Link II is/is not illuminated then
further aid might be available.

Hmm, sounds old and strange. Does any of the jumpers pins lead to pin 10
or 12 of the floppy connector?

>I know, I know, this is a huge shot in the dark ;) But before I
>experiment, I thought I'd see if anyone had any ideas!

You could see if you can get another old PC drive, or new for that matter.

Well I finally got this one fixed up. Turns out the floppy drive had given out. I tried one that still worked and it worked fine. Another minor trouble I discovered was that without the rf sheild the keyboard was shorting out on the 2.5meg ram upgrade board and certain keys wouldn't work. But managed to put an piece of plastic (yes ESD proof) in as an insulator. Now allI gotta do is get my TT working with some external hard drives.

Hi Robert,

>>In Germany there's a Atari dealer selling brandnew original Atari 16MB
>
>Sorry, but i -think- they sell nothing :)
What makes you think this?? Last february I bought a new drum and
toner for the SLM printer from them.

>Two or three years! ago i ordered one of these phantasic cheap LYNXII
>consoles online. I never get it. No answer, no answer of any fax, email
>or something. I`m still waiting today for this lynx :)
Well, then that's very unfortunate for you... over the last ten years I
bought heaps of stuff from them, I order with fax and they usally sent a
mail or letter back confirming the order. When the goods are actually
shipped then they normally sent a fax or mail as well.

>Where you found that offer? Backside of an ST-Computer magazine?
>Do you get any answer from that adress?
No, about twice a year they mail me some sort of newsletter. They don't
advertise in ST-Computer anymore. I've checked the address, phone & fax
numbers again to make sure I didn't make a mistake.

Cheers from Belgium
Dennis

Hmm, I have just took a peek at keyboard from 1040ST and hav noticed that
there aren't any
decent decoupling caps on it. Try connecting some small elko, like 10
microF/10V or so across power line at the keyboard side. One good point to
do it would be on the 74LS244 IC on the keyboard PCB.
GND should be on the pin 10 and Vcc on the pin 20.

What RESET pin ? If there is RESET line for the keyboard then it probably
should be
connected to machine, as intended and not left floating...

If ST's keyboard has a RESET line and MEGA ST does not, it means that
designers wanted to shawe off some costs with ST and they have borrowed
RESET signal from the machine itself.
With Mega ST, they probably decided that having RESET circuit in keyboard is
cheaper that extra wires in the cable.
It probably has to be reset at power-up and left inactive since.
You can try that. When keyboard "hands" after power-up, try connecting RESET
signal to the GND briefly (with pullup resistor of several KOhm-anything
from 1K to 10 K-usually not critical).
If after that kbd recovers, you have found cause of trouble.
Now you have to make some kind of circuit to reset kbd at pw-up.
Simplest thing would be to use elko of say 100 mikroF/10V between RESET and
GND and one diode (like 1N4148), pointing from RESET to Vcc. That way, RESET
will stay low after power-up just enough to cause RESET of the kbd , while
elko is filled through pullup resistor. Diode takes care of dischrging elko
when everything gets powered off.

If that is not good enough, use something like DS1232 from Dallas. Thing has
3 pins, GND, VCC and RESET, just what you need and doesn't need extra
components.

Regards,

Branko

Phone wire to long? DOITST contain an one ic driver circuit.
(Symtoms sounds like a long, not shildet, signal wire)

Reset pin normaly is to set keyboard cpu into and defined position.
4pin keyboads, like MegaSTe, contains an other "reset" circuit.

> http://homepage1.nifty.com/cobap/atari/keyboad.html

Japanese harakiri? :)

Nobody use siciors and tape to work on electronics :->

Both my ST and Falcon have there keyboards external and I've been very
naughty using unshieled cable too at about 2 metre length. I've
experienced problems with the keyboard sticking on the keys in the top
left of the keyboard, mostly escape, 1 or 2. To cure this I hit the key
and it works. It's not a sticky key as it does this on both and they've
been cleaned very well. It gets worse when the CPU is under tough loading.

I'll try this cap decoupling the 5v line as there ight be nasty noise
getting onto the Tx or Rx line. I'll proabably put a main 100uf in at the

connector where 5v comes in and maybe a 10uf over the top of the 244 or hitachi chip. There seems to be some ferite cores to filter interfernce of some sort, perhaps coming down the power lines? The tracks aren't visible.

Keyboard does not have capabilities to drive signals through lines so long
and especially unshielded.
Use shielded cable and decouple keyboard. If that does not cure the problem
100% then you should use line drivers on both side (RX and TX lines), that
is, if all the lines are unidirectional.
If you want to do it god damn right-way once and forever, use good RS-485
drivers and receivers, which should do nicely for up to 1 km of wire ;o)).

>
>Keyboard does not have capabilities to drive signals through lines so long
>and especially unshielded.

And especially when I have hundreds of cables coming down the back of my
computer.  I have five 4way strip extension leads each going from one to
the other in a line to my one and only mains outlet :).  Mind you this is
safe as I'm not running much heavy duty equipment here (well my amp sucks
350va at full power).  The only problem I could see is interfernce getting
on the lines, bit like bar vs star earthing techniques.

>Use shielded cable and decouple keyboard. If that does not cure the problem
>100% then you should use line drivers on both side (RX and TX lines), that
>is, if all the lines are unidirectional.

I found a problem with getting shieled cable small enough in diameter as
it was quite big IIRC when I last looked.  I'm sure the Tx and Rx are
unidirectional but don't line drivers need 12v?  I guess an old maxim
charge pump could fit in.

>If you want to do it god damn right-way once and forever, use good RS-485
>drivers and receivers, which should do nicely for up to 1 km of wire ;o)).

Heh, really useful. :)

Well, I would first try with old 74LS14. It has six inverters (schmitt
trigger) with same pinout as ordinary
74LS04. Just feed Rx and Tx through two inverters-each on its end of the
wire and that would be it. For good measure use something like 100 Ohms
resistor in series with each output of the LS14 that goes to the wire and
also in front of any LS14 input that comes from the wire. That should
supress too steep edges, and somewhat terminate the line...

Off course, that means that you need two chips and use two (out of six)
inverters inside each chip...

I guess true RS232 transievers are not really needed. I'll try adding shielded cable and smooth the keyboard out a bit.

Do you know (or anyone else) what the two extra pins are for on the
keyboard conenctor inside the Falcon? They're marked on the schematics as
something T and something R but I can't find where they lead too? Maybe a
feature that was going to be put on the keyboard that Atari ditched to use
a cheap ST keyboard with cosmetic changes.

RS232 transceivers are not most suitable for this. No need to mess with
+/-12V when good old 74LS14 should do the trick and as I said...

Wouldn't know about that. I have had only a few Falcons in the service,
never bothered to order
docs for it and frankly, never liked that stuff. Too much complications for
too little effect IMHO.

Heh?! Little effect? What about the DSP? The Falcon could do a lot more
in it's time compared to the ST in its time. OK some seriuos design flaws
but must have been rectified.

My apologies to all for the confusion; it's the red LED on The Link 2
that is/is on. It's getting power from somewhere, but still
apparently reports itself missing when the bootdisk (or any of the
configuring software) seeks it out. Termination of the SCSI series on
the 230 is (according to its documentation) not required. It sounds
like a Link 97 handles the 230 just fine.   But if ICD also makes/made
that, then I'm still in trouble! Anyone know where to find a new or
used Link 97? W.

You can purchase the LINK97 directly from WB Systemtechnik:

http://www.wbsystemtechnik.de/atari/

```

Falcon have failed to deliver in its time, compared to PeeCee.
When ST arrived, no PC could come close to it, regarding machine speed and graphic capabilities.
Still, machine was relatively simple- good CPU, nimpeded by design (0 WS memory access etc).

Falcon wasn't so much faster than existing PCs (if at all) in CPU speed terms, had weak graphics capabilities (for serious work) etc. And above all, it wasn't modular (motherboard with plug-in cards etc).
Yeah, it had DSP, which is slowish even compared to some more modern microcontrollers.

If you look at ST's motherboard you won't find a chip that is not standard, or can be replaced with standard solution. That makes it friendly for making changes. Falcon has everything casted in stone, I mean realised in custom, proprietary chips.

Falcon's CPU was story for itself. Atari made its buck when using 1040's housing, they didn't have to
use cheapest 030 also. A 030 on at least 33 if not 50 MHz should be used IMHO...

Given the fact that similar trick like with 68000 regarding interlieving CPU & video shifter is not
possibble with 030, they should throw in at least 256 Kb cache, like on ANY PC motherboard at the time and make SIMM sockets for FAST RAM, like on TT.
That would get them decent&fast videores, very nice CPU speed and good base for effective CPU upgrade with 040, when it came out.
DSP is nice, but with that arrangement it wouldn't be so essential and machine would be usefull for much wider range of applications.
How could they blow things up so much ?

I mean, take ST concept-MEGA 4ST as a concrete example. Use 030 instead of 68000. That means that you have to use twice wider data bus, but all ROMs and RAMs inside could be refitted with little or no extra cost. All costs would came from need to have those few extra custom designed chips made for higher clock rates and twice the databus width. O.K., now let's forget about blitter (if that means too much added costs to design new one), throw in 256 fast SRAM's for L2 cache, a few extra SIMM sockets for DRAM, wired solely to the CPU + a few multiplexers and some logic (AKA fast ram) and existing sound hardware from STE and Voilla- you got "much better from any angle" ST.

Sure, some odd things from ST wouldn't work on HyperST, but new versions would take care of that eventually.

For good measure, they could make provision for card, containing nothing more than extra cache RAMs, but for buffering the picture, so that CPU could have all main RAM bandwidth for itself and users could strike a balance between the $$ and amount of framebuffer they want. Given the price of old&faulty PeeCee boards pretty soon practicaly all users would have something like 1Mb of framebuffer with 50ns access time (or better), which is very nice and back then it would be awesome! Animation speed would be spectacular, machine shouldn't cost arm&leg and development costs would be much lower. Heck, whole thing could be done as a new board for MEGA ST housing...

Regards,

Branko

Hi

>Falcon wasn't so much faster than existing PCs (if at all) in CPU speed
>terms, had weak graphics capabilities (for serious work) etc. And above all,
>it wasn't modular (motherboard with plug-in cards etc).
>Yeah, it had DSP, which is slowish even compared to some more modern
>microcontrollers.

Modern you say above, exactly. In it's day it was powerful, even more so
than the CPU on quite a few jobs. Only in the last few years has it
really been pushed to full potential.

>Falcon's CPU was story for itself. Atari made its buck when using 1040's

>housing, they didn't have to
>use cheapest 030 also. A 030 on at least 33 if not 50 MHz should be used
>IMHO...

It amazes me why they used a 030@16Mhz when putting it to 32Mhz like done
in the TT did improve power quite well. Seeing as these have L1 cache...
It also would have sounded better which will bring more sales to the non
technical minded.

>Given the fact that similar trick like with 68000 regarding interlieving CPU
>& video shifter is not
>possibble with 030, they should throw in at least 256 Kb cache, like on ANY
>PC motherboard at the time and make SIMM sockets for FAST RAM, like on TT.

I thought the RAM was shared with the CPU and videl alternativly. 256kb
was comen in most PCs at that time, 386s had no L2 at that time.   Well
not on mine. The sparrow had all custom chips in PGA (nice) and simm
sockets.

>That would get them decent&fast videores, very nice CPU speed and good
>base for effective CPU upgrade with 040, when it came out.

Yeah and no slow down when you want to run a high res.

>DSP is nice, but with that arrangement it wouldn't be so essential and
>machine would be usefull for much wider range of applications.
>How could they blow things up so much ?

By pulling out even before it was finished? I guess the guys were a bit
low on moral and rushed it out.

>I mean, take ST concept-MEGA 4ST as a concrete example. Use 030 instead of
>68000. That means that you have to use twice wider data bus, but all ROMs
>and RAMs inside could be refitted with little or no extra cost. All costs
>would came from need to have those few extra custom designed chips made for
>higher clock rates and twice the databus width. O.K., now let's forget about
>blitter (if that means too much added costs to design new one)

Blitters's redundant and quite useless with NVDI.

>, throw in 256
>fast SRAM's for L2 cache, a few extra SIMM sockets for DRAM, wired solely to
>the CPU + a few multiplexers and some logic (AKA fast ram) and existing
>sound hardware from STE and Voilla- you got "much better from any angle" ST.

Use 16bit DMA, far better, and when you're running a fast 32bit bus it's
no problem.

>Given the price of old&faulty PeeCee boards pretty soon practicaly all users
>would have something like 1Mb of framebuffer with 50ns access time (or
>better), which is very nice and back then it would be awesome!

What's more important, whole machine should be designed for any clock speed
030, and with provisions for later upgrade with 040. When did you ever buy
"turbo upgrade" for PC ?
Even if available, no one sane would do that. Unless the board was designed
to do this, new CPU wouldn't run at its full potential. When you want to go
from 486 to Pentium, you don't byu an adapter,
you change motherboard. Unless, of course the board already has

Pentium-compatible socket, but even then, you just plug-in new CPU and you don't mess with adapter of any sort.

TT was meant to work on 16 MHz initially, and was later fitted with special adapter with 32 MHz CPU.
Pitty.

>

Well, you have hit nail on the head. Have you ever heard about 486 or even 386 board without the cache ? Just for fun, try disabling L2 cache on the board of any 386 or 486 board (in board settings, under "BIOS settings" make "EXTERNAL CACHE" disabled) and then see what this does to speed ;o).
But this is not all. Now try to find one of those boards that had VGA output, but none framebuffer RAM- so the board had to generate picture out of main RAM and see what this does to 386's "awesome" speed.

Now, try to convince yourself that this is the future of computing- true Workstation force and sell it to yourself for something like $1.200 ;o))))

O.K. I admit, this is somewhat simplified, devil is in the details, but the bottom line is that they should have done much, much better job.

Me too ;-)

Seriously, I am really low on time these days (except for the time for emails like this :-), but I would really love to do something like this. Nothing revolutionary, just cram up all cool hardware hacks together on one card and make it GPL, so anyone could just download the files, take them to the local PCB shop and have his PCB done for atari compatible...

Regards,

Branko

Unless the 230 is capable of self-termination (not the going up in smoke
variety!) then I doubt that statement. Easy way to find out, plug a terminator
block into the other SCSI connector on the back.

>like a Link 97 handles the 230 just fine.   But if ICD also makes/made
>that, then I'm still in trouble! Anyone know where to find a new or

>used Link 97? W.

It might be that the 230 requires parity, which the LinkII does not supply. It is possible to make a small circuit that will, see the Vezz hardware pages on the 'net.

Can anyone out there tell me how to make my Stacy boot from the hard
drive? I accidentally deleted the necessary files and I've been
booting from the hard disk utilities floppy ever since. I've tried
copying all the files from that disk onto the hard drive to no avail.
Thanks, Kerry.

I have used 3 metre telephone leads on both my TT and Mega STE keyboards for
the last 6 yrs with no problems at all.
Why not stop faffing about with the ST keyboard and just obtain a
Mega ST or STE keyboard.
All standard gear, better feel, job done, no problems.

Barrie at Keychange.

You need to install a system (SYS) file on your partition that you want
the computer to boot from. You should have software that installs this
file on your hard drive somewhere (ICD, HDDriver). What software do
you have???

Hi;
Lately I was shown (thanks, Lindon A.) the docs for a nice 8MB RAM-expansion board, designed for Amiga but which apparently might work as an alternate RAM on a (Mega)ST. The docs are quite detailed, even the PCB layout is included and the form factor is convenient, address decoding range can be made OK, all parts are standard TTLs and DRAM SIMMs, etc. etc. The only detail which puzzles me is that the board relies on the computer making a memory-access somewhere OUTSIDE the board's address range often enough for that to act as a trigger for DRAM refresh. My docs for DRAMs of board's vintage say that each "row" in a DRAM must be refreshed at least every 4 milisecondss, and if there are 1024 rows in a 1MBit chip I understand that a refresh must be initiated every 4 microseconds or so. Now, I can't see that a ST, WHEN DOING NOTHING, can make RAM accesses at that rate- the only activities which repeat on a regular basis seem to be Hblank and Vblank, but Hblank happens only every 25 microseconds or so- much too rare. I am not familiar with Amiga's hardware design, but I am suspicious that even there the computer would strobe RAM addresses all the time and so often (except maybe for video?)

Any comments? Does ST access some address often enough for this board to work unmodified?

Cu.

One of the utility programs will allow you to "Install" the hard disk
driver, copying it is not good enough it must be installed.

I'm guessing that you'd be using AHDI so you need to run a program in
that package called "HINSTALL.APP" and look for the relevant menu option
i mentioned, after that it should boot fine again.

If your not using AHDI it would help us if you tell us what you are
using.

Edward, I've been duh all this time, as the following exchange
explains. James emailed me directly. I'm sure that your advise also
would have been enough to jump-start my brain, Thanks

James, Amazing. I had opened that program several times, without
knowing
it was what I needed and that I simply needed to click file and
install.
That's it....done. After eliminating all unnecesary auto stuff, the
Stacy
boots in nothing flat. Sometimes it takes someone else to point out
the
obvious. Thanks. By the way, C-Lab's "Notator" for the Atari ST is
still
the best MIDI sequencing program in existence, for any computer.
Kerry.

Because-

a) I fitted a mini din for keyboard and can't be arsed to change it

b) I have Keyclicks which is OK

c) I have mouseburster and both ports mounted on the rear so the mouseburster is internal

d) I don't want Spanish Keytops

e) It's original

Hi, It would be nice if I could connect my Atari to my SX64's serial port
and send files like that. I don't own a 1581 as I've never seen one and
guess they're rare.

Hmm, this is definitely not the case with the TT. I have installed everything for X from the Debian Linux site, but there is something wrong with the XF86Config file for the TT. I would like to thank Uwe Seimet for sending me his XF86Config file, but I cannot get it to work. :((I am running the 2.2 Kernel) I have tried to added different resolution modelines but to no avail.

I get the following:

```

I had problems with that file also. Someone emailed me some FAQ about it and it helped me. There is a sample file created when you install X Window and that is the file I used. Of course I had to rename it. I emailed the info. If you do not receive it, let me know here.

Hmmm, this doesn't work either. I have copied the file over.
I get the following:

```
XFree86 Version 3.3.6 / X Window System
(protocol Version 11, revision 0, vendor release 6300)
Release Date: January 8 2000
        If the server is older than 6-12 months, or if your card is newer
        than the above date, look for a newer version before reporting
        problems.  (see http://www.XFree86.Org/FAQ)
Operating System: Linux 2.2.10 m68k [ELF]
Configured drivers:
   FBDev: Server for frame buffer device
   (Patchlevel 11): mfb, iplan2p2, iplan2p4, iplan2p8, ilbm, afb, cfb8,
cfb16, cfb32
(using VT number 3)

XF86Config: /usr/X11R6/lib/X11/XF86Config
```

```
(**) stands for supplied, (--) stands for probed/default values
(**) Mouse: type: Microsoft, device: /dev/mouse, baudrate: 1200
(**) Mouse: buttons: 3
(**) FontPath set to
"/usr/lib/X11/fonts/misc/:unscaled,/usr/lib/X11/fonts/cyrillic/:unscaled,/usr/lib/
X11/fonts/100dpi/:unscaled,/usr/lib/X11/fonts/75dpi/:unscaled,/usr/lib/X11/fonts/
Speedo/,/usr/lib/X11/fonts/Type1/,/usr/lib/X11/fonts/misc/,/usr/lib/X11/fonts/
cyrillic/,/usr/lib/X11/fonts/100dpi/,/usr/lib/X11/fonts/75dpi/"

You must provide a "Screen" section in XF86Config for at
least one of the following graphics drivers: fbdev

Fatal server error:
No configured graphics devices

When reporting a problem related to a server crash, please send
the full server output, not just the last messages

X connection to :0.0 broken (explicit kill or server shutdown).
```

I have version 3.3.6 of the X Window System and have tried the
xserver-configure command. Now I get:

```
(**) FBDev: Using default frame buffer video mode

Fatal server error:
fbdevScreenInit: unable to set screen params (Invalid argument)
```

I am running the 'startx' command. Is there some other command to start
X?

Thanks again,
Chris

MFP is certainly right as written above. I'd be pretty sure on the Shifter (as it is a 48pin DIP) and I know both the MMU and Glue are in PLCC package of 68 pin size. I would suggest you get Chips'n'Chips from http://unimo.chimo.it/~vezz/atari/hardware under docs section
If that URL is wrong switch unimo and chimo around as I find it dificult remembering it.

I can't remember which version I had, I think I had a German version when I last had it. I know the pictures of the pinouts worked. I've never seen a HYP with IMG files, I thought they were embedded/compiled into the actual HYP.

>
>Is this correct? If not, what should I do exactly at this point?

As I read it the shifter DE and MMU DE are connected together and MFP DE
and Glue MFP are conencted together. Many have done this mod so should be
able to help.

>As for the pin 5 of the keyboard ACIA -the instructions don't mention
>*which* of the two 6850 chips it is....

That was a bit silly of them. It's the keyboard one, but both are next to
each other (unlike in the Falcon) so unless you're good with the
multimeter and schematics then someone else will help here.

>Vcc available in a multitude of places
>   *I take it this is +5V, right?*

Yes, you could get this off the last pin of many 74xxxx chips or take it
off the large smoothing cap. Just check it's 5v.

>Anything else useful to add?

Hmm, can't think of any. High density drive? ESSC/RSVE on it?

I did Lacescan for a few friends, but last one was more than a year ago and I can�t remember all the details.

DE signal is generated by glue, it means "Display Enable" and it tells MMU&Shifter that they should
generate picture. For the MMU it means that it should fetch the next word from picture buffer memory and for Shifter it means that it should shift fetched word out, 1 pixel at a time. When DE is inactive, MMU does fetch anything for shifter and shifter outputs black.

I think you got chip numbers right.

Whole trick with lacescan is that one disconnects GLUE's DE form rest of the circuitry and to generate that signal from his electronics. With lacescan whole mod is to use HSYNC instead of DE.
In other words, that means there is no dead time between end of the visible line and returning electron beam to the start of the next line (for the software weenies- there is no white space before the CRLF ;o))))
One exception to the rule is MFP (I'm not sure about this-check it out !).
It has to be fed old DE for some software compatibility reason. That is why all the fuss around trace cutting is about. You have to make sure that MFP and GLUE end together and MMU and shifter on the other.

This guarantees you maximum area for picture, although horisontal edges will be distorted, but software takes care of that.
So, lacescan informs TOS about new picture geometry and can even accomodate picture size and some other details for you. That is, once you open the door for maximum picture area, picture at the edges will be bad and lacescan can make border of soutable thickness to accomodate that.

I think I have still on my disk code for GAL chip, which you can program instead of having several TTL's. On top of that, you can easilly fit inside also HD floppy hack (frequency MUX for FDC).

One thing that I couldn't find mentioned anywhere and that took me DAYS each time I was persuaded to made one, is that at the time of boot you should have left SHIFT key pressed in order to invoke settings...

Regards,

Branko

Hi, Hallward
I may be able to help you, as I have installed lacescan in my MegaST and
have some additional information- a couple of pictures, etc. I will
send you an e-mail tonight or tomorrow, as it would be going into too much
detail for this forum.

btw. I seem to remember that you mentioned this Mega of yours already
had LaceScan installed and you removed it. Why not just reconnect all
points which you disconnetted :)

Cu.

Which version of C'nC are you using? I have 5.00 and that has all
the images embedded - as *all* HYPs should have; AFAIK the images
are only separate in the uncompiled *.STG versions.

Just one thought. I wonder whether you have the path for image
display included correcrtly in ST-GUIDE.INF? Mine has here:

```
# A list of file extenders and paths to external viewers may follow:
IMG=G:\imagecopy.4cd\ic42b2pl.prg
```

Of course path and filename will need adaptation to your setup.

Regards, /Peter/

Hi all,

This is my first posting here, so please bear with me! I've been looking on and off for a while now for the answer to a problem I'm having, but not yet seen anything similar.

My problem is that I have an Atari TT. Nice machine, TOS 3.06, 2 meg of normal ST RAM and 4 meg of TT RAM. The problem is the machine keeps bombing.

Two places seem most obvious. The first is inserting a write-protected diskette. The machine locks up. The second place is when I'm just using the machine, after a while it just bombs and freezes.

At first I thought it was a problem with TOS, but I'm not sure anymore. It's possibly the TT RAM I installed, but again, I'm not sure. Hense this note. Has anyone ever ran into the same problems as I'm going though?

Many thanks for any help!

Peter Goffee.

Tos 3.06 is the latest for the TT and should not be so unstable.
Mine has the same version. I would suggest checking to see
if perhaps the TT ram upgrade you put in is actually
set to use burstmode. If it's an orginal Atari upgrade, these
where notorious for burstmode problems. If you are unsure
I'd remove the upgrade and see if the machine settles down.

The floppy problem is very strange, not sure what to think of that
one.

I'd like to add that maybe cleaning contacts of chips or pushing them down a bit might help. If an ST can do it, why not a TT? TTs are very reliable. I'd also suggest removing the upgrade, and try cleaning the simms on them (if it does have simms, I wouldn't know).

>The floppy problem is very strange, not sure what to think of that
>one.

This I've never heard of or seen. I would try a different floppy drive and if tha still does the same thing then it may be the AJAX floppy controller. Why it would bomb the machine I really don't know!

I have the same problem with one of my 1040's. For me, it was loose chips. I just open up the computer and press down on all the chips and that fixes it for awhile. I would open up the TT and see if anything looks loose. Check the RAM also.

Hi all,

Many thanks for all the help! I played with the machine a little more last night and decided that it was time to remove the memory upgrade. The problem was when I bought the machine, I upgraded the memory at the same time. It's not crashed since I removed it from limited testing, so it seemed like the TT memory was at fault. I looked on the Internet for more information, and found an article which said what SIMMS I should have used. These were 8 or 9 chips SIMMS. The ones I had used were 3 chip. This is most likely the problem with random lockups. I noticed that the same time the card supported 4meg SIMMS too, so I am thinking of buying 4 * 4meg 9 chip 30 pin SIMMS to replace what I am using. Does this sound like it might solve this problem?

I will try pushing all the chips down. The puzzling thing is, diskettes without the write-protection work great, but diskettes write-protected always lock the machine up. Weird...

Many thanks once more!

Peter Goffee.

Is that freeware? Last version I saw was shareware and restricted. 7Mb?!
That is a helluva lot bigger than my version too. It must have grown a
lot, can't see how it could possibly be that big.

Hmm, 4MB 30 pin sims are expensive, the local computer shop to me was selling them at 10 ukp each. If you're good with the soldering iron I would have thought you could put a 16Mb 72pin FPM module in. It may be cheaper picking up a new board that supports more memory in 72 pin format.

>I will try pushing all the chips down. The puzzling thing is,
>diskettes without the write-protection work great, but diskettes

Try another floppy drive, if the drive is for a PC just change it to DS0 with the solder pad/jumper. Don't use it for long as you need a small mod to make it recognise a disk chang, just for atest purpose, don't write to it.

Hey Lyndon,

Well, the thing is I spent quite a bit of money getting the TT RAM board in the first place. I'm currently looking at about 14 quid each in the UK, so, 4 of them.. it'll be a little expensive, but it is a one-off payment for these things. I wish to get Linux running on the box someday soon, so the extra memory will be very useful!

I don't really want to risk making my own board and suchlike right now. That thar be yee hardware! *grin* I've been stuck in Software Engineering for years, and one day I'll start experimenting in hardware, but not this week! :)

I'll order the memory from Novatech. It's not a lot more expensive than the 1 MEG SIMMS, so I think I can justify myself to my wallet, but I'm sure it'll give me a hard time over it.

I'll check out trying to get the media change problem on my diskette drive sorted next!

Many thanks :)

I've seen this before and the fix in my case was to re-seat the CPU and
any other chips that are socketed.
Just be careful if you decide to try this.

Btw. Branko, at what pace exactly does this happen? I tried to calculate
the timings for a standard ST-High display (640 pixels horizontal resolution)
and can't get compatible numbers. I.e.: basic MMU frequency is 16 MHz.
If picture width, Hsync-to-Hsync, is 800 pixels (is it?, someone here said
once it is exactly so) then 800 pixels is 50 16-bit words. If a counter
in MMU divides 16 MHz by 9 (this seems to be the only appropriate number),
and then outputs 50 16-bit words at this pace (1.7777MHz) I get a Hsync rate
of 35.5kHz not the nominal 35.7kHz. Even taking into account that the clock is
in fact 16.02 MHz, the result is not correct. What is wrong with my numbers?

cu.

MMU can execute one memory access cycle every 250ns. Odd ones are for

CPU/Blitter/DMA access while even ones are for reading picture (or vice versa, depends where you start counting :o). So, one word gets read every 500ns, when DE signal is active. Since there are 16 pixels in the word, that means that pixel clok is 16-times higher than word reading rate. Word reading rate is 1/500ns=2MHz and pixel shifting rate is 16x2Mhz=32MHz (for monochrome mode).
I don't remember exactly geometry of the frame, but if we suppose that line is 800 pixels long (brutto, including the time for sync etc) that means 800/16=50 word accesses, which is 25 microseconds=40 kHz. Fact that vanilla ST has lower linerate means that lines are longer. If we assume 72 frames per sec and brutto 500 lines in each frame, that means that each line lasts for 27.7 microseconds or 56 memory access slots, which translates to 896 pixels brutto. It would be realistic to estimate wideness of both borders (left and right) to some 80 pixels and to gove rest of the time to beam to come to the start of the next line. That would mean 80 pix(left border) + 640 pix (desktop) + 80 pix (right border) + 96 pix for retrace....

That would also mean that if we leave retrace time as it is, maximal achievable resolution would be
800 pixels hirisontally, which in practice is not achievable. Beam needs some time to stabilise after retrace and before retrace some time is needed to shut the beam.

Regards,

Branko

Has anyone been able to run these cartridges on the mega ste's or Falcon or is there any updated software that will allow these to work on these machines.

I can see the additional drives that the cartridge can add would be helpful for Falcon owners.

Just in case anyone doesn't know what these cartridges are, here are some details.

This is the BEST disk backup hardware available for the ST and can back up not just Atari disks. The cartridge takes over control of your floppy drives AND only needs ONE floppy drive, unlike blitz and syncro system hardware. It also verifies the data on the drive, making very accurate. Compare it to the blitz turbo hardware, which is very hit and miss!

Once you have got the parameters set for a specific disk, it will duplicate that disk EVERY time:)

It also has the facility to read the disk into a file and takes advantage of you system memory.

Now that's the BASIC version or OPTION 0.

the other options, which can be added, are: pass through cartridge port, an extra 2 external floppy drives, real-time clock, and even able to use it as a Mac emulator (like the Spectre).

```

Compared to SDRAM it is, and the price is slowly increasing like 72 pin
simms.

I have a number of RGB files grabbed with a Rombo Vidi-ST (12) digitiser.

Does anyone know an easy way of reading these files on a PC?
Or the file format perhaps?

Ideally I'd like to read the file directly into something like
PaintShopPro - rather than go the Atari emulator running the original
software route.

Any help appreciated.

Hiya,

Check around in the local library system for this book.  I found, and
read it in the Mississauga central library (Canada for those in other
parts of the world).  I've seen it pop up in other library catalogues
too.  Its definately a glimpse into the early days of atari but not
totally accurate and hopelessly out of date since its nearly 20 years
old.

Hiya,

Here in Toronto a set of 4 4meg 30 pin simms will run you $30 to $40 (Can funds). You could also try picking up an older 486 system cheap at a surplus shop and scavange the simms since they often used the correct type.

Lyndon Amsdon wrote:

Hi David,

I'm not sure bout the speaker or led connection but the battery can be a standard type, Rayovac makes one that works perfectly, I've got on in my TT right now in fact. I cant remember the exact part number but if you email me I'll get back to you with that since I'll be working on the innards of my TT again tomorrow. Its a rectangular shape battery with a 3 or 4 pin connector running at 4.5v as I remember.

David Johnson wrote:

> I'm trying to revive a TT030/8 that's been sitting in disarray and in peices in a closet for some years.
>
> Problem #1. led, speaker, and battery leads removed. Unfortunately, there aren't clear indications on the mobo as to what goes where.
>
> Problem #2 Missing screws. Does anyone know off hand what size case screws are required to secure the mobo?
>
> Problem #3 That damn sheilding. I've got a TT030/8 with a 32mhz processor and TOS 3.00. It's got that gray metal sheilding in side. Part of the reason the computer sat idle for many years was that immediately after dis-assembly, I couldn't see how to get the sheilding back together w/o it leading to shorts n' such. I found out from the guy at ATY computers that could just rip it all out.
>
> But that said, where is a good place for the speaker to go. Hmmm. will probably depend on where the speaker lead ultimately goes to.
>
> Problem #4, Clock battery. Off hand, where is the best source?
>

Hi James,

One place I often buy Atari specific parts is Best Electronics at
bestelec@concentric.net. Thats assuming you don't have any local
sources available such as an otherwise dead 1040st you might find at a
user group flea market

Hiya,

I've got a used 520ST, one of the originals with external floppy disk. Its been upgraded with a zubair 2.5 meg ram upgrade and a TOS Extension Card. Its set up to boot up in TOS 2.6. Problem is, when I power it up, it does the memory test (and passes it) then does the delay to allow the hard disk to spin up, when I press a key to go on or wait for the delay the machine bombs every time with 4 bombs. Has anyone had a similar situation? or better yet does anyone remember what error is associated with 4 bombs?

thanks,
James

4 bombs: illegal instr.
or 2x2bombs bus-error

i had this with colored icons in deskicon.rsc once

4 bomb is for illegal statement.
I think that it happens when you don't have floppy drive attached, or there
is some error around floppy controller - TOS 2.06 specific error.

I've managed to get a set of 4 4meg 30 pin simms on eBay for 16 pounds
in British money. So, I'm happy now! :) Soon my TT will have the
correct memory, and a lot of it. Hopefully. For 16 pounds, even if
it's not the answer, it's not too much money.

Hi All!

There have been several comments about Linux and Xwindows for the TT030.
I finally got Xwindows working on my TT030 thanks to Claude, Edward and
Uwe. I have posted the working XF86Config file here:

http://jybolac.virtualave.net/bbs/XF86Config

Currently, I have only tested this in 640x480 (4 bit color).

I think mode modes like 320x480 (256 colors) need to be set up in the
/etc/fb.modes file.

Thanks and cheers,
Chris

I looked it up last night, IIRC 4 bombs means an illegal instruction.

Did this set up ever work?, if it did then it could be a loose connection to one of the upgrade boards, if not then it could be a hardware problem.
AFAIK TOS 2.6 will assume that there is a Blitter Chip fitted as the original STs it was installed in would have been fitted with them, most 520STs espically the early ones did not have Blitters fitted and so unless someone knows otherwise I suspect that TOS is crashing because it is looking for the the Blitter Chip and can't find it.

Stephen Moss.

TOS 2.6, actually TOS 2.06 is right name... works very well without
Blitter chip.

You can try it without opening Atari - there is software loader, which
loads & relocates TOS 2.06 in any ST(E) machine.

Hi,

I don't know whether anyone out there can help, I'm one of those pariahs with a Milan computer. The things is although the serial ports work (or are recognised) correctly under iConnect, they refuse bluntly to be recognised by STiK or STinG,
as you can imagine this puts a lot of the Atari's best internet software out of my reach, unless I resort to buying iFusion.I'm using your plain vanilla Milan with 32 megs of memory, with Mint/MAES as the operating system. I am also using Milan's serial drivers for HS modem.

Any help will be greatly appreciated,

Thanks

Thomas

Well!!! yes you are right. a software version was produced that loaded
tos 2.06 from disk. BUT you don't get the full benefit you get on ROM,
and it eats up memory.

iirc the blitter shouldn't bother it to much, it should detect and
adjust for the blitter.

Hi all,

I am new to this group, and to the ST.

I recently got hold of a 520ST, but the power supply was missing. I hope to use a converted A500 supply to get the ST running, but I need the pin out and specs for the power connector on the computer.

Any help would be appreciated.

jorn

Hi Peter,

Sorry for jumping in this late.... although your problem is fixed, this posting might be usefull to someone else.

>I'll order the memory from Novatech. It's not a lot more expensive
>than the 1 MEG SIMMS, so I think I can justify myself to my wallet,
>but I'm sure it'll give me a hard time over it.

In Germany there's a Atari dealer selling brandnew original Atari 16MB FAST RAM card expansions. The price for such a board is DM 111 which is roughly 35 UKP...
The cards are delivered to European countries by COD, so one doesn't risk losing his money either in the transaction:-/

Sorry, I've got no URL or email address, but they do understand English and sending them a fax for additional info, doesn't cost a fortune...

Pentagon Computers Gmbh
Heerbrink 4
31079   Almstedt
Germany
Tel 050-6090-6666
Fax 050-6090-6686

Pentagon has a very long list of bargains and difficult to locate parts.
New SM124 monitor   : DM 111 or 35UKP
new Lynx II   : DM 59 or 19UKP
Games for Lynx   : DM 49 or 15UKP
Milan (standard)   : DM 1499 or 475UKP
Ajax Chip   : DM 38 or 12UKP
Logitech Atari mouse : DM 49 or 15UKP
TOS-Card with AT-interface for all ST's: DM 166 or 52UKP
4MB expansion for Stacy: DM222 or 69UKP

etc... just ask for their complete list

Cheers from Belgium
Dennis

Sorry, but i -think- they sell nothing :)

> new Lynx II   : DM 59 or 19UKP

Two or three years! ago i ordered one of these phantasic cheap LYNXII
consoles online. I never get it. No answer, no answer of any fax, email
or something. I�m still waiting today for this lynx :)

Where you found that offer? Backside of an ST-Computer magazine?
Do you get any answer from that adress?

Regards, Robert

All power levels should regulated for over-voltage and over- current protection. The following are minimal power supply specifications:

AC Input	115 VAC 10% at 60 Hz (fused)
DC Output	+5 VDC at 3 A 5% +12 VDC at .03 A 10% -12 VDC at .03 A 10%

```
----- Power Port Pin Assignments ---------------

   ST           DIN 7P
                ----
                  1 |<--- +5 VDC
                  3 |---- Ground
                  4 |<--- +12 VDC
                  5 |<--- -12 VDC
                  6 |<--- +5 VDC
                  7 |---- Ground
                ----
```

Help my TT has TOS 3.1 and its as buggy as hell!!!

I cant get my 1.44Mb floppy drive to read high density disks even with a =
new AJAX chip (tested and good) with the right dip switch setting.

You dont get Atari logo/memory test on 3.1 either,

anyone have some roms for sale, or some burnt on an EPROMer. I can =
provide a 3.6 rom image.

Will buy off anyone in any country, of course I'll pay as it long as its =
not stupid money!!   I've already spent fair bit of money on a 1Gb hard =
disk, clock battery and AJAX floppy controller chip, despite getting the =
teety at a obscenely low price.

John H

Hello !

We have a ST4 in our studio with a 60 MB HDD.

What is the best (and fastest) way to tranfer the files to a PC ?

Is there a way of doing this like a PC Null-modem cabel ?

Leif Hole

A null-modem cable and appropriate terminal software on both ends running at
the highest speed both sides can handle is easier if you have a lot of
files, or if they're bigger than can fit on one floppy!

The best and fast way is, when you use the program PARCP.
You can download it from: http://joy.sophics.cz/

> Is there a way of doing this like a PC Null-modem cabel ?

It�s possible, but slow.

I've posted this on the other group, with no reply so far. I've an Atari 1040 ST with no modulator on the back, and find to my surprise that there is no composite video output, which I assumed would be there. I can't seem to get RGB working either, yet I can sort of half see a picture if I use the RGB as composite, so know it is working, and I can hear audio too.

I would be grateful for help with the options here, ideally I would simply like to put composite video out from the video connector that's on the back.

Geoff.

is
> no composite video output,

Mega ST is the same, I recall.

> I would be grateful for help with the options here, ideally I would simply
> like to put composite video out from the video connector that's on the
back.

Considering the cost of a replacement motherboard, either get one or use the
scart option.
Much less hassle.
I guess the ST is using TOS 1.00 so kill several birds with one stone.

Barrie at Keychange.

I have the pinouts for the Falcon and the monitor, how should i connect the two together? Here's what I got

Falcon:

1: RED
2: GREEN
3: BLUE
4: MONO/OVERLAY
5: GND
6: RED GND
7: GREEN GND
8: BLUE GND
9: AUDIO OUT
10: GND

11: GND
12: COMPOSITE SYNC
13: HORIZONTAL SYNC
14: VERTICAL SYNC
15: EXTERNAL CLOCK INPUT
16: EXTERNAL SYNC ENABLE
17: +12V
18: VID MODE 1
19: VID MODE 2

Monitor:

1: GND
2: GND
3: RED
4: GREEN
5: BLUE
6: INTENSITY
7: COMPOSITE SYNC
8: HORIZONTAL SYNC
9: VERTICAL SYNC

There were some settings for the Falcon as well:

M0	M1	Monitor
0	0	MONO
0	1	VGA
1	0	RGB
1	1	TV

What do they mean and how do I set it up? Thanks.

Joshua

from old post........

There were very few STFs compared to the rest of the STs. I think standard STs used the RF cct to create a Sync signal? Any way you need to use 6 signals from you ST. R, G, B, horizontal and vertical sync and grnd. You need a FULL scart caplable TV to use it. But you cannot use it on a Composite input unless you get a specific device to do so. You could get an Amiga external modulator and make a cable to connect that, then use the Composite port on that.

```

OK here we go. It is quite simple when you look at the pins that are used. All you need is a 19 pin plug and a 9 pin plug. Going from the falcon to the 1084 it would be like thus. pin 1 to 3 (red), pin 2 to 4 (green), pin 3 to 5, (blue), 13 to 8 (horizontal sync), 14 to 9 (vertical sync), pins 5, 10 and 11 should all be tied to pins 1,2 and 3 (ground), and importantly tie pin 10 to 18 on the Falcon end. This last bit tells the Falcon to expect an rgb monitor. It does this to get the sync frquencies right. The m0 and m1 signals are active HIGH, which meens the input is always a logic 1, if you look at the table above you will see that if nothing is plugged in it will expect a Tv. Which is good as the TV cable uses a seperate port. Clever eh;-)

I think there is some setting which must be made in the Quantum drive regarding parity or something like that.

Does anyone remember, and know how to do this?

Thanks,

Thanks yes, I did see that post, but it doesn't really answer anything,
since looking at a scart, there is nothing that suggests itself to be a
sync, either horizontal vertical, or (presumably) nanded together as a
composite sync, and thats the heart of my problem. I just need a clear
indication of how an Atari ST connects to a standard European PAL RGB-ready
TV, which is clearly possible with minimal components, and I will be a happy
bunny

regards
Geoff

This would indicate that the TV is not a full scart implementation. I would
try the Amiga modulator approach, or try to find an STFM or equiv. Quit
simply the ST will not work with that Tele any other way. There are
proprietary modulators floating around from time to time. Maybe someone has
on floating around?

Mark

Hi All!

I was wondering if there was anyone out there who has installed Debian Linux 2.2 on an Atari TT030, and who has managed to get Xwindows working on the stock Atari video hardware. If so, can you let me know how to do this?

Since I have installed Linux on my TT, several people have asked how did I get Xwindows working. Well, I didn't, and after messing with it for a few days, it doesn't seem like it is too easy to do. If anyone has modelines for the XF86Config file that work, that would also be helpful.

Thanks,
Chris

Atari -> SCART which I have is connected like this:

	Atari pin		pin SCART	
Audio	1	- 43k Ohm -	2,6	Audio L+R
Csync	2	- - - - - - - -	20	Csync
Green	6	- 120 Ohm -	11	Green
Red	7	- 120 Ohm -	15	Red
+12V	8	- - - - - - - -	8	Video in detect?
Hsync	9	- - - - - - - -	16	Blank? Hsync?
Blue	10	- 120 Ohm	7	Blue
Ground+Shield	13	- - - - - - - -	4,5,9,13,17,19	Ground

and it works fine on a MegaST which, although it does not have a modulator, has a composite-sync signal on the monitor connector. This cable also worked fine previously with a 520STFM (version with a 1040STFM motherboard).

Quote from another source, for a slightly different layout:

>Atari pin2=Csync, or when the ST has a TV modulator, then it is composite video

>Note that the horizontal and vertical sync pins from the ST are
>connected to pin 20 of the SCART connector via 470 ohm resistors (one in
>each line, not both connected together through one resistor). According
>to the Philips monitor manual SCART pin 20 (normally composite video in)
>is also used for the syncronisation signal of a linear RGB input.

>It may be worth connecting the audio out from the
>ST (pin 1) to both left (pin 6) and right (pin 2) audio inputs on the
>SCART connector, otherwise you'll only get sound out of one speaker if
>you have a stereo monitor or TV.

And what appears to be SCART specification from yet another source:

>SCART
>21 PIN SCART FEMALE at the Video/TV.
>21 PIN SCART MALE at the Cable.

>Pin	Name	Description	Signal Level	Impedance
>1	AOR	Audio Out Right	0.5 V rms	<1k ohm
>2	AIR	Audio In Right	0.5 V rms	>10k ohm
>3	AOL	Audio Out Left + Mono	0.5 V rms	<1k ohm
>4	AGND	Audio Ground		
>5	B GND	RGB Blue Ground

>I've posted this on the other group, with no reply so far. I've an Atari 1040 ST with no modulator on the back, and find to my surprise that there is no composite video output, which I assumed would be there. I can't seem to get RGB working either, yet I can sort of half see a picture if I use the RGB as composite, so know it is working, and I can hear audio too.
>
>I would be grateful for help with the options here, ideally I would simply like to put composite video out from the video connector that's on the back.

I know what would solve your problem. You need to find a hardware device called a Video Key. It connects in the monitor port and allows hook up to a TV and even has audio and video out (RCA Jacks) ports. I used one to hook up my ST to VGA monitor using also a video converter.

I installed Debian Linux on my Hades 060 and also installed XWindow. I really do not know how I got it to work. I just got all the files and then loaded it in and it worked. Now I want to try to load one of the other Desktops. You may be missing a file or two.

You don't need any modelines for the Atari because the frame buffer device is used. Most of the data in XF86Config that deals with monitor settings is not relevant for the TT.

In my case, the drive is coming OUT of an Atari, and going INTO a
Kurzweil sampler, where it's not recognized as a DOS drive, and I
think that's becuase of parity checking.   I seem to recall that when
the drive was installed in the Atari, the technician had to use some
kind of utiliy to disable (or enable?) parity checking on the drive.
Some LPS's have jumpers for this but the LPS340S doesn't.

So that's why I need to find out how to enable parity-checking on the
drive itself.

This won't help. You will not gain anything when switching ON parity
checking except that the drive can detect some errors it would not be
able to detect otherwise. But it will not change anything else.

I'm curious about something else related to Quantums and STe and Megafile
30s.
I have an Atari STe not a mega STe, and I have a Megafile 30 HD... which has
bad
sticktion these days. I have an old Quantum LPS 230 which was formatted
originally
for a Macintosh.

I've used two other Mac Quantum LPS hard drives 160MB & 120 MB drives
to install in my EMAX II. They dropped right in and ran perfectly, once I
set the jumper switches to SCSI 1. But the LPS230 would not be recognized.

So now see this question posted on the this newsgroup, I thought
maybe the internal Quantum LPS 230MB would be able to be used on my Atari
STe
somehow. Does anyone out there know about this?

You cannot format a drive for a particular platform. The only thing that
is different on different platforms are the file systems. All that's
needed to use, for example, a drive previously used for a Mac with an
Atari, is to partition it. Formatting is just a waste of time.

I know that from the SCSI specification, which describes features like

parity checking. So if you need details you should have a look at the
specification.

Note that a few hard disk require the adapter to have a SCSI ID of its
own, in order to be capable of doing initiator identification by
hardware. The only adapters that support this are the LINK96 and LINK97
adapters. So if you want to be absolutely sure that your device really
works with the ST/STE you should go for one of these.

> I don't have much experience with IDE drives, so I can't say which is
> better or if it's irrelevant to the average user. Maybe someone else
> here can shed some light on the issue.

It's impossible to comment on this with a few words. Basically IDE
drives are cheaper, but they also pose more problems. The specification
is crap and again and again hacks have been added in order to circumvent
problems with high capacity drives etc. With SCSI this is much more

professional.
Note that the IDE port of Atari machines does not support DMA, but ACSI
and SCSI do support DMA. So if you want to profit from non-blocking
transfers (as supported with MagiC and HDDRIVER) you cannot use IDE.

Well, the UDS/LDS couple replaces A0 line itself. If you *really need*
to 'generate' a0 signal then just latch uds/lds and then combine latch
outputs. Note that uds/lds cannot be active simultaneously.

grngs,

Kylo :-)

Hi,
Has anyone here installed linux and xwindow on a TT030 successfully?
If so, I need help.
I have asked in the linuxM68 group, but they all seem to be mostly Mac
and Amiga people.

Any help would be greatly appreciated.

Thank you.

Claude Bourgoin

I have X-Windows running here on MiNT, using the port of XFree86
found on http://x11.freemint.de/

> I have asked in the linuxM68 group, but they all seem to be
> mostly Mac and Amiga people.

Not surprising.

Amiga people seem to make it a point to purposely bash Atari and
ensure that Atari users be kept out of mainstream 68k development
or scene. Slashdot repeatedly refused to add Atari.org to their
Slashboxes and Atari as a topic, while organisers of the demo
gathering Assembly explicitely ban Atari from the competitions.

Mac users are far more friendly, but they have no knowledge
whatsoever of anything happening outside their platform. They
started as happy Mac users and eventually installed Linux on
their no longer supported 68k Mac when they got themselves an
iMac or G4 workstation, but that's all they know. They usually
rather easy-going, nice people, but cannot provide much of any
help to anyone else.

(You do......)

The IDEal interface is available from Keychange Music
(and is on my web page,)

www.keychange.co.uk

price �35 plus post. Fitting can be arranged.

It is supplied and works with AHDI 6.

I also have genuine Atari TOS 2.06 roms for the STE
if autobooting is important.

Barrie at Keychange.

Hey, on a 1bit transfer, surely they're both low? We have the problem
sussed though. Michael Schwingen kindly helped me.

Thanks

> or scene.

Huh? Do you know what Linux is? Everyone can develop what he
want. But most people doesn't want to develop, they ask every
time when will be MY hardware supported. So they get the answer:
then YOU drivers for YOUR hardware develop.
So why should it not allowed for Atari-users to write drivers
for there hardware?
If you ask for hardwarerelated things its clear that
you get no answer from these kind of people (amiga-mac-user).

Its also the same on the Amiga-scene itself. If you use a
cyberfb: framebuffer you can't answer even simple questions
about f.e. clgenfb:
The time for bashing or a war between Amiga/Atari/PC or whatever
is long ago.

> Mac users are far more friendly, but they have no knowledge
> whatsoever of anything happening outside their platform.

So why should Amiga-users know about Atari-specific questions?

regards, Andreas

Most people don�t know programming. Not everybody working under Linux is an
IT expert. Even if you want to learn it, you will need some people of the
scene to tell you the tricks.

> Its also the same on the Amiga-scene itself. If you use a
> cyberfb: framebuffer you can't answer even simple questions

The major problem is, that the people maintaining the Atari specific things
become less and less. And since m68k need more time to compile packages and
not enough platforms are available to do the job, time runs out.

>> Mac users are far more friendly, but they have no knowledge
>> whatsoever of anything happening outside their platform.

> So why should Amiga-users know about Atari-specific questions?

In the debian-m68k list people were quite helpful, when I started installing Debian on my TT. Roman, one of the major driving forces for Atari, is now about to write his PhD thesis or is perhaps ready with it. I guess, he has got less time now to invest in it. Besides that, the m68k manufacturers weren�t quite helpful. About some years ago, they promised a half prize 040-Milan for further development of m68k Linux. This Milan was never delivered! Quite motivating for the m68k maintainers!

Regards,

Kerstin

Firstly, many thanks to Mark Bedingfield for helping me out with the pin connections. I managed to wire up the connectors and everything works great. My games have never playd this good :) Now I'm wondering if it's possible to make a dual-outlet for a VGA and RGB and use a switch to switch between the two? Thanks.

Joshua.

Yes, its also the same with me :). But if you choose a platform
without real "Linux-distributions" you must have these knowledge.

> Not everybody working under Linux is an

> IT expert. Even if you want to learn it, you will need some people of the
> scene to tell you the tricks.

Right, but you have to be shure it maybe becomes a little bit tricky to
run these on your home-machine.

> The major problem is, that the people maintaining the Atari
> specific things become less and less.

So its allowed to blame Amiga-people for?

I know this, i even try to run Linux on my Amiga4000-Box. But i don't like
the attitude: you get no help for Linux on Atari because most m68k-Linuxer
are Amigans wich will definitly bash the Atari-hardware and don't like to
help because of you are using an Atari.

regards, Andreas

Hmm, I consider Debian a real distribution. Users can still be helpful to the maintainers in testing and reporting bugs or writing manuals.

It is a little bit more difficult, if you have exotic hardware (I�ve got three "weirdoes" here) and don�t know how to fix bugs in the source code or write your own drivers. Programming knowledge may be helpful, but if a non-IT person is curious enough to jump into the cold water and just try: It is another kind of adventure game. This was my approach to try Linux on my Atari TT about 3 years ago. I was curious about how unixoid operating systems work.
